**seghol** (se-gōl'), *n.* [< Heb. *seghol* (so called  
for its appearance), lit. 'a bunch of grapes.']  
In Heb. gram.: (a) A vowel-point consisting  
of three dots placed under a consonant, thus  
ע, and indicating the sound of an open *e*, usually  
short, as in English *met*, but also long,  
nearly as in *there*. (b) The sound represented  
by this vowel-point.

**segholate** (seg'ō-lāt), *n.* [NL. *segholatum*; < *seghol*  
+ *-ate*1.] In Heb. gram., a noun or noun-  
form (adjective, infinitive, etc.) of a type usu-  
ally represented by dissyllables pointed with a  
long tone-vowel in the first and a short *seghol*  
(ē) in the second syllable. *Segholates* have a mono-  
syllabic primitive form with one short vowel (ā, i, u), be-  
longing usually to the first radical. By giving the second  
radical a short *seghol* as helping vowel, the form becomes  
dissyllabic. The first syllable then becomes open, and, taking  
the tone, appears as long *e* (*seghol* or *tere*) or long *o*.

**segm.** An abbreviation for *segment*, used in bot-  
anical writings. Gray.

**segment** (seg'ment), *n.* [= F. *segment* = Sp.  
*fig. segmento* = It. *segmento*, *semento*, < L. *segmentum*,  
a piece cut off, a strip, segment of the earth, a strip of  
tinsel, ML. in geom. (tr. Gr. *τμήμα*) a segment, < *secare*,  
cut; see *secant*, and cf. *section*, *sector*.] 1. A part cut  
off or marked as separate from others; one of the  
parts into which a body naturally divides  
itself; a section: as, the segments of a calyx;  
the segments of an orange; the segments of a  
leaf. Specifically, in *zool.* and *anat.*: (a) One of the rings,  
somites, or metameres of which the body of an animal  
is theoretically or actually composed, as an arthropod  
of a worm or crustacean, or a diarthromere of a vertebrate.  
See cuts under *Callinomerus*, *epidote*, *Polioptilum*,  
*peanotium*, and *promethes*. (b) One of the three pri-  
mary divisions of either fore or hind limb of a vertebrate,  
corresponding to the parts known in man as the upper  
arm, forearm, and hand, or the thigh,  
leg and foot. See cut under *pro-  
som*1. (c) One of the three rings or  
divisions of the skull; a cranial seg-  
ment which has been by some con-  
sidered a modified vertebra.

2. In geom., a part cut off from  
any figure by a line or plane.  
A segment of a circle is a part of the  
area contained within an arc and its  
chord, as ACB. The chord is some-

times called the base of the segment. An angle in a seg-  
ment is the angle contained by two straight lines drawn  
from any point in its arc to the extremities of its chord or  
base.

3. In her., a bearing representing one part only  
of a rounded object, as a coronet or wreath:  
usually a piece less than half of the circle.—  
Abdominal, basilar, maxillary, postoral, etc., seg-  
ments. See the adjectives.—Calcifying or calcific  
segment. See *calcify*.—Segment of a line, the part  
included between two points.—Segment of a sphere,  
any part of it cut off by a plane not passing through the  
center.—Similar segments of circles. See *similar*, 3.

**segment** (seg'ment), *v.* [< *segment*, *n.*] I.  
*intrans.* To divide or become divided or split  
up into segments. (a) In *embryol.*, to undergo seg-  
mentation, as an ovum or vitellus. See *segmentation*. (b)  
In *physiol.*, to reproduce by semiofission or budding.

Before this occurs, however, the vegetal unit, if it does  
not divide, may *segment* or bud; the bud grows into a unit  
similar to its parent, and this in its turn may also *segment*  
or bud.

Bastian, The Brain as an Organ of Mind, i.

II. *trans.* To separate or divide into seg-  
ments: as, a segmented cell.

**segmental**, *n.* Plural of *segmentum*.

**segmental** (seg'men-tal), *a.* [< *segment* + *-al*.]

1. Having the form of the segment of a circle;  
being a segment: as, a segmental arch.—

2. Of or pertaining to segments or segmenta-  
tion: as, a segmental formula; segmental parts;  
segmental organs.—3. Specifically, in *embryol.*,  
noting the primitive and rudimentary renal or-  
gans which occur in all vertebrates and some  
invertebrates, consisting in the former of  
branched tubules opening at one end into the  
somatic cavity and at the other by one or more  
main ducts into the cloaca or hindgut. The seg-  
mental organs of a vertebrate are divisible into three  
parts, anterior, middle, and posterior. The fore-  
most is the head-kidney or *pronephron*, whose duct becomes a  
Müllerian duct. The next is the Wolffian body proper, or  
*mesonephron*, whose duct is the Wolffian duct. The last  
or hindmost is the rudiment of the permanent kidney,  
whose duct is the ureter; this is the *metanephron*. The  
epithet *segmental* in this sense was originally used  
to note the kind of renal or excretory organs which annelids,  
as worms and leeches, possess, in more or fewer of the seg-  
ments of the body, whence the name; it was subsequently  
extended to the above-described embryonic renal organs  
of vertebrates which are replaced by permanent kidneys—  
these segmental organs being thus loosely synonymous  
with primitive kidney, Wolffian body, and *pronephron*.  
See cut under *leech*.

**segmentally** (seg'men-tal-i), *adv.* In a seg-  
mental manner; in segments: as, the spinal  
nerves are arranged *segmentally*.

These organs, being . . . *segmentally* arranged, are  
termed segmental organs or nephridia.

Huxley and Martin, Elementary Biology, p. 244.

**segmentary** (seg'men-tā-ri), *a.* [< *segment* +  
*-ary*1.] Segmental; pertaining to or indicating  
segments: especially noting in entomology col-  
ored bands, rings, or other marks on the abdo-  
men, corresponding to successive segments, as  
in many *Lepidoptera*.—*Segmentary geometry*. See  
*geometry*.

**segmentate** (seg'men-tāt), *a.* [< L. *segmenta-  
tus*, ornamented with strips of tinsel, lit. hav-  
ing segments, < *segmentum*, a segment: see *seg-  
ment*.] Having segments; segmented. *Encyc.  
Brit.*, II. 292.

**segmentation** (seg-men-tā'shon), *n.* [< *seg-  
ment* + *-ation*.] The act of cutting into seg-  
ments; a division into segments; the con-  
dition of being divided into segments; the man-  
ner in which a segmented part is divided.—  
*Segmentation cavity*, in *embryol.*, the central space in-  
closed by the blastomeres of the embryo, before the for-  
mation of gastrula by invagination; the hollow of a blas-  
tospere; a blastocoele.—*Segmentation nucleus*, the  
nucleus of an impregnated ovum or germ-cell, result-  
ing from fusion of a male and a female pronucleus, and ca-  
pable of undergoing segmentation.—*Segmentation of  
the vitellus*, in *embryol.*, yolk-cleavage; morulation; the  
first process of germination of the ovum of any metazoic  
animal, by which the original single cell of which the  
ovum primitively consists becomes converted, wholly or  
in part, into a mass of similar cells, constituting a morula  
or mulberry-mass. The cells thus formed are specified as  
*cleavage-cells*, *blastomeres*, or *segmentella*. Segmentation  
goes on in different cases with some variations, chiefly  
due to the presence of food-yolk and the position of this  
yolk relatively to the formative yolk (see *centrolecithal*,  
*telolecithal*). Total segmentation is necessarily restricted to  
holoblastic ova; it is distinguished from the partial seg-  
mentation of meroblastic ova (see *holoblastic*, *meroblastic*),  
the terms meaning respectively that all, or that only some,  
of the yolk segments. Total segmentation is equal or regu-  
lar when the whole germ-cell divides into two similar  
cleavage-cells, and these into four, and so on, the resulting  
gastrula being the archigastrea. Total segmentation is  
*unequal* or *irregular* when the cleavage-cells are unlike  
one another; it results in the amphigastrea. The partial  
segmentation of meroblastic eggs is always unequal, and  
either *discooidal* with formation of a discogastrea, or *su-  
perfacial* and forming a perigastrea. Total equal segmen-  
tation is also styled *primitiv*, *primordial*, and *pathege-  
netic*, the modifications introduced in unequal and partial  
segmentation being described as *homogenetic*. Other terms,  
descriptive rather than definitive, are used by different

writers; the foregoing is nearly Haeckel's nomenclature.  
See *egg*1, *ovum*, *vitellus*, and cuts under *gastrula* and *gas-  
trulation*.—*Segmentation rhythm*, the rate of produc-  
tion of successive cleavage-cells, or their numerical ratio  
of increase, whether 2, 4, 8, 16, 32, etc., or any other mode  
of multiplication.—*Segmentation sphere*, a ball of  
cleavage-cells; a blastosphere; a morula.

**segmented** (seg'men-ted), *a.* [< *segment* +  
*-ed*2.] Divided into segments, segmenta, or  
segmentella; characterized by or exhibiting  
segmentation; somitic; metameric: thus, the  
body of a vertebrate is *segmented* according to  
the number of vertebrae, whether any actual  
division of parts may be evident or not.

**segmentellum** (seg-men-tel'um), *n.*; pl. *seg-  
mentella* (-ā). [NL., dim. of L. *segmentum*, a  
cutting; see *segment*.] One of the cleavage-  
cells which result from segmentation of the vi-  
tellus of a fecundated ovum: same as *blas-  
tospere*. See cut under  
*gastrulation*.

**segment-gear** (seg'-  
ment-gēr), *n.* A

by oscillating on a center instead of reciprocating  
in slides or guides. E. H. Knight.

**segment-saw** (seg'men-sā), *n.* 1. A circular  
saw used for cutting veneers from squared logs,  
consisting of a conical disk having the apex cen-  
tral with the arbor, and very thin firmly toothed  
segmental saw-plates fastened to the outer mar-  
gin of the disk. Such a saw having a diameter of 60  
inches would be about 16 inches thick at the arbor—the  
object being to bend the veneers out like a thin shaving  
as they are sawed from the log.

2. In *surg.*, same as *Hey's saw*. See *saw*1.

**segment-shell** (seg'men-shel), *n.* A modern  
projectile for artillery, usually in the form of  
a conical or oblong shell for rifled guns, in  
which an inner cylinder of thin iron contains  
the bursting-charge, and this is contained in  
an outer shell composed of segmental pieces  
which are either thrown in all directions on the  
bursting of the shell, or thrown forward, accord-  
ing to the arrangement made: the whole is  
cased in lead for transportation and loading.

**segmentum** (seg-men'tum), *n.*; pl. *segmenta*

segment-rack.

**1.** A Spanish dance, usually of a lively character, for two dancers. Three varieties are distinguished, the manchega, the bolera, and the gitana, the first being the most vivacious, and the last the most stately. The origin of these waves is generally considered to be sudden local variations in the barometric pressure, attended with the development of local cyclonic winds. A similar phenomenon on the shores of the Baltic is called (in German) *see-bar*, as meaning a sudden and temporary oscillation or fluctuation of the water-level in a lake or nearly or quite landlocked parts of the sea: it has been (incorrectly) Englished *see-bar*.

If government, however, throws the expense of coinage, as is reasonable, upon the holders, by making a charge to cover the expense (which is done by giving back rather less in coin than is received in bullion, and is called "levying a *seigniorage*"), the coin will rise to the extent of the *seigniorage* above the value of the bullion. *J. The largest known seine was used for shad at Stony Point on the Potomac in 1871; it measured 3,400 yards, or nearly 2 miles; the lines and seine together had a linear extent of 5 miles, and swept 1,200 acres of river-bottom; this net was drawn twice in 24 hours.

**seismic** (sis'mik), *a.* [< Gr. *seismos*, an earthquake, + *-ic*.] Pertaining to or of the nature of an earthquake: relating to or connected with an earthquake, or with earthquakes in general. To a considerable extent, *seismic* takes the place of *earthquake* used as an adjective or in compound words. Thus *seismic center* is the equivalent of *earthquake center*, etc.—**Seismic area**, the region or part of the earth's surface affected by the shock of an earthquake.—**Seismic center**, or **seismic focus**, the point, line, or region beneath the earth's surface where an earthquake-shock is started or originated.—**Seismic vertical**, the

part of the earth's surface which is directly over or nearest to the seismic focus. Sometimes called the *epicenter* or *epicentrum*.

See *seismometer*.

**seismograph** (sis'mô-gráf), *n.* [< Gr. *seismos*, an earthquake, + *γράφειν*, write.] Same as *seismometer* (which see). The more complicated forms of instruments contrived for the purpose of recording the phenomena of earthquakes are sometimes called *seismographs*, and sometimes *seismometers*. The name *seismograph* was first employed in reference to the elaborate seismometer contrived by Palmieri and used at his station on Mount Vesuvius. This was called by him a "sismografo," and this name has generally been Englished as *seismograph*, which is also the designation most generally applied by the members of the Seismological Society of Japan to the seismometers there contrived and used within the past few years.

**seismographer** (sis-mog'ra-fér), *n.* Same as *seismologist*. [Rare.]

**seismographic** (sis'mô-graf'ik), *a.* [< *seismograph* + *-ic*.] Of or pertaining to seismography; connected with or furnished by the seismograph: as, *seismographic records*, *observations*, *studies*, etc.

**seismological** (sis-mô-loj'i-kal), *a.* [< *seismology* + *-ic*.] Relating to or connected with seismology, or the scientific investigation of the phenomena of earthquakes.

The object of all *seismological* investigation should be, primarily, to determine both the true direction and velocity of motion of the particles set in motion by the earthquake-wave. Oldham, Cachar Earthquake, p. 90.

**seismologically** (sis-mô-loj'i-kal-i), *adv.* In a seismological aspect.

**seismologist** (sis-mô-lô-jist), *n.* [< *seismology* + *-ist*.] A scientific investigator or student of earthquake phenomena; one who endeavors, by the aid of seismometric observations, to arrive at the more important facts connected with the origin and distribution of earthquakes.

The labour of collecting and calculating further and future *seismologies* will be in a great degree thrown away, unless the cultivators of science of all countries . . . shall unite in agreeing to some uniform system of seismic observation.

R. Mallet, in Trans. Brit. Ass. for Adv. of Sci., 1858, p. 1.

**seismology** (sis-mô-lô-jî), *n.* [< Gr. *seismos*, an earthquake, + *λογία*, < *λέγειν*, speak: see *-ology*.] The branch of science which has for its object the investigation of the causes and effects of earthquakes, and, in general, of all the conditions and circumstances of their occurrence.

The objects and aims of *Seismology* are of the highest interest and importance to geology and terrestrial physics. R. Mallet, in Admiralty Manual of Scientific Enquiry (3d ed.), p. 327.

**seismometer** (sis-mom'e-tér), *n.* [< Gr. *seismos*, an earthquake, + *μετρον*, a measure: see *meter*<sup>1</sup>.] An instrument by the aid of which the data are obtained for the scientific study of earthquake phenomena. The forms of instruments used for this purpose are varied, and more or less complicated, in accordance with the wishes and means of the observer. A common bowl partly filled with a viscid fluid, like molasses, which, on being thrown by the earthquake-wave against the side of the bowl, leaves a visible record of the event, is one of the simplest forms of seismometer which have been proposed, as giving a rude approximation to the direction of the horizontal element of the wave. Another simple form of seismometer consists of two sets of cylinders, each set numbering from six to twelve, and the individual cylinders in each uniformly decreasing in size. These are placed on end, one set at right angles to the other, on plates resting on a hard horizontal floor, surrounded by a bed of dry sand, in which the cylinders when overturned will rest, exactly in the position originally given by the shock. This instrument is theoretically capable of giving the velocity of the horizontal component of the shock, its surface-direction in azimuth, or the direc-

tion of the horizontal component of the seismic wave, and also the direction of translation of the wave. In practice, however, the results given by this simple and inexpensive apparatus have not been found satisfactory. The seismometer now most generally used in large observatories, or those where accurate work is expected, involves Zollner's horizontal pendulum, the use of which was proposed many years ago, but which was put into the present practical form by Messrs. Ewing and Gray. The group of instruments constituting the seismometer of Prof. J. A. Ewing is arranged to give a complete record of every particular of the earthquake movement, by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass which is made to revolve uniformly by clockwork, the clock being started by an arrangement similar to that of the Palmieri seismoscope. To this is added another clock which gives the date of the shock and the interval which has elapsed since it took place. Another and simpler form of seismometer designed by Mr. Ewing, and called the "duplex-pendulum seismograph," does not show the vertical element of the disturbance, nor exhibit anything of the relation of time to displacement; but it is in other respects satisfactory in its performance. Of this latter form, fifteen sets were in use in Japan in 1886, and others were being made for other countries. Compare *seismograph*, and see cut under *seismoscope*.

Instruments which will in this way measure or write down the earth's motions are called *seismometers* or *seismographs*. Milne, Earthquakes, p. 13.

**seismometric** (sis-mô-met'rik), *a.* [< *seismometer* + *-ic*.] Of or pertaining to seismometry or the seismometer; used in or made, produced or observed by means of a seismometer: as, *seismometric instruments*; *seismometric observations*.

The theory and use of the seismometer; more generally, the scientific study of earthquake phenomena by the aid of observations made either with or without the use of seismometric instruments.

**seismoscope** (sis'mô-sköp), *n.* [< Gr. *seismos*, an earthquake, + *σκοπεῖν*, view.] A name of the simpler form of seismometer. It is generally so arranged that the exact moment of passage is noted by stopping a clock, either by direct mechanical means or by the use of an electric current. The epoch may also be registered on a revolving cylinder or other similar device. The essential part of a seismoscope usually consists of a delicately suspended or balanced mass, the configuration of which is readily disturbed on the passage of the seismic wave.

To construct an instrument which at the time of an earthquake shall move and leave a record of its motion, there is but little difficulty. Contrivances of this kind are called *seismoscopes*. Milne, Earthquakes, p. 13.

**seismoscopic** (sis-mô-sköp'ik), *a.* [< *seismoscope* + *-ic*.] Relating to or furnished by the seismoscope: as, *seismoscopic data*, *observations*, etc.

This particularity renders him either venerable or ridiculous, according as he uses his talents.

It is characterized by flowers with a corolla of five or sometimes four equal or unequal spreading lobes, four didynamous or two equal stamens, one-celled anthers, and a superior one- or two-celled ovary, forming one or two small nutlets in fruit, often with a fleshy surface and corky furrowed or perforated interior, investing a pendulous cylindrical seed with fleshy albumen. It is distinguished from the related order *Sclerophyllinæ* by its solitary ovules, from *Labiata* and *Verbenaceæ* by an embryo with a superior micropyle and radicle, and from its ally the *Myoporinæ* by habit and terminal inflorescence. It includes about 140 species belonging to 8 genera, of which *Selago* is the type. They are natives of the Old World beyond the tropics, chiefly diminutive heath-like shrubs of South Africa, with alternate, narrow, and rigid leaves, and small flowers grouped in terminal spikes or dense globular heads, commonly white or blue, rarely yellow.

Selago*, a genus separated from *Lycopodium (-gin-)*, lycopodium: see *Selago*.] A genus of heterosporous vascular cryptogams, typical of the *Selaginellaceæ* and *Selaginellæ*. They have the general habit of *Lycopodium* (the ground-pine, club-moss, etc.), differing from it mainly by the dimorphic spores. The stems are copiously branched, trailing, suberect, samentose, or scandent; in shape they are more or less distinctly quadrangular, with the faces angled or flat. The leaves are small, with a single central vein, usually tetrastichous and dimorphic, and more or less oblique, the two rows of the lower plane larger and more spreading, the two rows of the upper ascending, adpressed, and imbricated; spikes usually tetrastichous, often sharply square, at the end of leafy branches; microsporangia numerous; macrosporangia few, and confined to the base of the spike. About 335 species have been described, from the warmer parts of the globe. Many species are cultivated in conservatories, and numerous forms have resulted. *S. lepidophylla* is well known under the name *resurrection-plant*, and is also called *rock-lily* or *rock-rose*.

Fertile Plant of *Selaginella lepidophylla*.

**Selaginellaceæ (sē-laj'i-ne-lā'sē-ē), n. pl.** [NL., < *Selaginella + -aceæ*.] A group of heterosporous vascular cryptogamous plants, by some called an order, by others raised to the rank of a class coordinate with the *Rhizocarpeæ*, *Lycopodiaceæ*, *Filices*, etc. It embraces only 2 genera, *Selaginella* and *Isoetes* (which see for characterization).

**Selaginellæ (sē-laj-i-nel'ē-ē), n. pl.** [NL., < *Selaginella + -æ*.] A group of heterosporous vascular cryptogams. By many writers employed as an interchangeable synonym with *Selaginellaceæ*, by others regarded as an order under the class *Selaginellaceæ*. It embraces the single genus *Selaginella*.

It is characterized by flowers with a two- to five-lobed calyx, nearly regular or somewhat two-lipped corolla, four didynamous and perfect stamens, and a two-celled ovary which separates into two nutlets in fruit. There are about 95 species, all South African except one in tropical Africa and one, *S. muralis*, growing on the walls of the capital of Madagascar. They are dwarf heath-like shrubs, sometimes small annuals, often low and diffuse, and with many slender branchlets. They bear narrow leaves, commonly alternate and clustered in the axils, and sessile flowers in dense or slender spikes.

**3.** In *biol.*, the separation of those forms of animal and vegetable life which are to survive from those which are to perish; the facts, principles, or conditions of such distinction between organisms; also, the actual result of such principles or conditions; also, a statement of or a doctrine concerning such facts; especially, natural selection. See phrases below.—**Artificial selection**, man's agency in modifying the processes and so changing the results of natural selection; the facts or principles upon which such interference with natural evolutionary processes is based and conducted. This has been going on more or less systematically since man has domesticated animals or cultivated plants for his own benefit. Such selection may be either *unconscious* or *methodical* (see below). It has constantly tended to the latter, which is now systematically conducted on a large scale, and has resulted in numberless creations of utility or of beauty, or of both, which would not have existed had the animals and plants thus improved been left to themselves—that is, to the operation of natural selection. Examples of artificial selection are seen in the breeding of horses for speed, bottom, or strength, or for any combination of these qualities; of cattle for beef or milk; of sheep for mutton or wool; of dogs for speed, scent, courage, docility, etc.; of pigs for fat pork; of fowls for flesh or eggs; of pigeons for fancied shapes and colors, or as carriers; in the cultivation of cereals, fruits, and vegetables to improve their respective qualities and increase their yield, and of flowers to enhance their beauty and fragrance.—**Methodical selection**, artificial selection methodically or systematically carried on to or toward a foreseen desired result; the facts or principles upon which such selection is based, and the means of its accomplishment. See above.

**Methodical selection** is that which guides a man who systematically endeavours to modify a breed according to some predetermined standard. Darwin, Var. of Animals and Plants, xx. 177.

In the case of *methodical selection*, a breeder selects for some definite object, and free intercrossing will wholly stop his work. Darwin, Origin of Species, p. 103.

**Natural selection**, the preservation of some forms of animal and vegetable life and the destruction of others, in the natural order of such things, by the operation of natural causes which, in the course of evolution, favor some organisms instead of some others in consequence of differences in the organisms themselves. (a) The fact of the survival of the fittest in the struggle for existence—which means that those animals and plants which are best adapted, or have the greatest adaptability, to the conditions of their environment do survive or other organisms which are less adapted, or less capable of being adapted, to such conditions. This fact rests upon observation, and is unquestionable. (b) The means by which or the conditions under which some forms survive while others perish; the law of such survival, and the agencies which effect that result. These seem to be mainly intrinsic, or inherent in the organism; and they are correlated, in the most vital manner possible, with the varying plasticity of different organisms, or their degree of susceptibility to modification by their environment. Those which respond most readily to external influence are the most modifiable under given circumstances, and consequently the most likely to be modified in a way that adapts them to their surroundings; which adaptation gives them an advantage over less favored organisms in striving to maintain themselves. Hence (and this is the gist of Darwinian natural selection)—(c) The gradual development of individual differences which are favorable to the preservation of the life of the individual, with corresponding gradual extinction of those peculiarities which are unfavorable to that end; also, the transmission of such modified characters to offspring, and so the perpetuation of some species and the extinction of others—a fact in nature respecting which there is no question, since we know that more species, genera, etc., have perished than are now living. (d) The theory of natural selection; any statement of opinion or belief on that subject, which may or may not adequately reflect the facts in the case. Ignorance alike of these facts and of this theory has been fruitful of misunderstandings and objections respecting the latter. Some of its supporters have made of the theory a cause of the facts which it is simply designed to explain; some of its opponents, unconsciously biased perhaps by some other extremists, have denied that the theory has any validity. Between these extremes, the author of the theory states explicitly that it neither originates variability, nor accounts for the origin of variations, in individuals, still less in species; but that, given the origination and existence of variations, it shows that some of these are preserved while others are not; that favorable variations tend to be perpetuated and unfavorable variations to become extinct; that those variations which best adapt an organism to its environment are most favorable to its preservation; and, consequently, that the

theory of natural selection is adequate to explain, to some extent, the observed fact of the survival of the fittest in the struggle for existence—that is, natural selection in some of its above. Natural selection in so far as it is concerned is specified as *sexual selection* (see below). The facts and principles of natural selection as now defined are used by man for his own benefit in his treatment of plants and animals, come under the head of *artificial selection* (see above). An extension of the theory of natural selection to the origination (as distinguished from the preservation) of individual variations has been named *physical selection* (see below).

This preservation of favourable variations and the rejections of injurious variations I call *Natural Selection*. Variations neither useful nor injurious would not be affected by *natural selection*, and would be left a fluctuating element, as perhaps we see in the species called polymorphic. Darwin, Origin of Species (ed. 1860), IV.

*Natural selection* . . . implies that the individuals which are best fitted for the complex and in the course of ages changing conditions to which they are exposed generally survive and procreate their kind. Darwin, Var. of Animals and Plants, xx. 178.

**Physical selection**, the law of origin for differential changes or modifications in organisms which have arisen through the action of physical causes in the environment, in habits, etc. It is distinguished from *natural selection*, which relates not to the origin but to the preservation of these changes. A. Hyatt.—**Sexual selection**, that province or department of natural selection in which sex is especially concerned, or in which the means by which one sex attracts the other comes prominently into play. Thus, anything which exhibits the strength, prowess, or beauty of the male attracts the female, and decides her preference for one rather than another individual of the opposite sex, with the result of affecting the offspring for the better; and this principle of selection, operative through many generations, may in the end modify the specific characters of animals, and thus become an important factor in natural selection.

If it be admitted that the females prefer or are unconsciously excited by the more beautiful males, then the males would slowly but surely be rendered more and more attractive through *sexual selection*.

Darwin, Descent of Man (ed. 1881), p. 496.

For my own part, I conclude that of all the causes which have led to the differences in external appearance between the races of men, and to a certain extent between man and the lower animals, *sexual selection* has been by far the most efficient. Darwin, Descent of Man (ed. 1871), II. 367.

**Unconscious selection**, artificial selection effected unknowingly, or carried on without system or method; man's agency in unmethodical selection, or the result of that agency. See the extract.

*Unconscious selection* in the strictest sense of the word—that is, the saving of the more useful animals and the neglect or slaughter of the less useful, without any thought of the future—must have gone on occasionally from the remotest period and amongst the most barbarous nations. Darwin, Var. of Animals and Plants, xx. 179.

**selective** (sē-lek'tiv), *a.* [ < *select* + -ive. ] Of, pertaining to, or characterized by selection or choice; selecting; using that which is selected or choice.

**Selective absorption**, the absorption of substances which arrest certain parts only of the radiation of heat and light from any source: as, the *selective absorption* of the sun's atmosphere, which is the cause of the larger part of the dark lines in the solar spectrum. See *spectrum*.

Their number is usually from three to nine in each town, and they constitute a kind of executive authority. In small towns the office is frequently associated with that of assessor and overseer of the poor. The office was derived originally from that of *select vestryman*. See *vestry*.

He soon found, however, that they were merely the *selectmen* of the settlement, armed with no weapon but the tongue, and disposed only to meet him on the field of argument. Irving, Knickerbocker, p. 235.

As early as 1633, the office of townsman or *selectman* appears, who seems first to have been appointed by the General Court, as here, at Concord, in 1639.

element was so called (by Berzelius) because associated with *tellurium* (< *L. tellus*, earth).] Chemical symbol, *Se*; atomic weight, 79. A non-metallic element extracted from the pyrite of Fahlun in Sweden, and discovered in 1818 by Berzelius. In its general chemical analogies it is related to sulphur and tellurium. It is found in combination with native tellurium, as in selen-tellurium, with sulphur in selen-sulphur; also in very small quantity in some of the varieties of iron pyrites, and in several rare selenides, as clausenite, or lead selenide, etc. When precipitated it appears as a red powder, which melts when heated, and on cooling forms a brittle mass, nearly black, but transmitting red light when in thin plates. When heated in the air it takes fire, burns with a blue flame, and produces a gaseous compound, oxid of selenium, which has a most penetrating and characteristic odor of putrid horse-radish. Selenium undergoes a remarkable change in electrical resistance under the action of light: hence the use of selenium-cells. See *resistance*, 3, and *photophone*.

**self** (self), *a., pron., and n.* [Also *Sc. self*, *self*; < ME. *self*, *self*, *seolf*, *self* (pl. *selfe*, *seolf*, *selve*, *selve*, *seolve*, later *selves*; in oblique cases *selven*), < AS. *self*, *seolf*, *self*, *seolf*, *self*, same, *self*, = OS. *self* = OFries. *self*, *selva* = OD. *self*, D. *self* = MLG. *self*, *self*, LG. *selvo* = OHG. *selb*, MHG. *selp*, G. *selb* (inflected *selber*, etc.), *selbst* (uninflected) = Icel. *sjálf*, *sjálf* = Sw. *själf* = Dan. *selv* = Goth. *silba*, same, *self*; origin unknown: (a) in one view (Skeat) the orig. form *\*selba* is perhaps for *\*seliba*, 'left to oneself,' < *se*, *si* (Goth. *si-k* = *L. se*, oneself, = Skt. *sva*, one's own self), + *lib*, the base of AS. *lifa*, be left, *lāf* = Goth. *laiba*, a remnant, etc. (see *leave*, *life*, *live*).] (b) In another view (Kluge) perhaps orig. 'lord, possessor, owner,' akin to Ir. *selb*, possession; cf. Skt. *patis*, lord, with Lith. *patis*, self; cf. also *own*<sup>1</sup>, *v.*, owner, with the related *own*<sup>1</sup>, *a.*, which in some uses is nearly equiv. to *self*. The use of *self* in comp. to form the reflexive pronouns arose out of the orig. independent use of *self* following the personal pronouns, and agreeing with them in inflection, in AS. as follows: *ic selfa* (*ic self*), 'I self' (I myself), *min selfes*, 'of me self' (of

myself), *mē selfum*, 'to me self' (to myself), *mē selfne*, 'me self' (myself), pl. *wē selfe*, 'we self' (we ourselves), etc.; so *thū selfa* (*thū self*), 'thou self' (thyself), *thīn selfes*, 'of thee self' (of thyself), etc., *hē selfa* (*hē self*), 'he self' (himself), *his selfes*, 'of him self' (of himself), etc., the adj. *self* becoming coalesced with the preceding pronoun in the oblique cases *mine*, *my*, *me*, *our*, *thine*, *thy*, *thee*, *your*, *his*, *him*, *her*, *their*, *them*, etc., these being ultimately reduced in each instance to a single form, which is practically the dative *me*, *thee*, *him*, *her*, *them*, etc. (in which the acc. was merged), mixed in part with the genitive *mine*, *my*, *our*, *thine*, *thy*, *your*, etc., these orig. genitives in time assuming the appearance of mere possessives, and *self* thus taking on the semblance of a noun governed by them, whence the later independent use of *self* as a noun (see III.). The reflexive combination *me selfe*, *him selfe* (*selve*), etc., came to be used, as the dative of reference, to indicate more distinctly the person referred to — 'I (for) my self,' 'he (for) him self,' etc., thus leading to the emphatic use. The former (AS. ME.) adj. pl. *-e* has now changed to the noun pl. *-es* (*selves*, as in *wolves*, *wives*, etc.). *Itself* and *oneself* retain the original order of simple juxtaposition: *it + self*, *one + self*. In the more common *one's self*, *self* is treated as an independent noun.] 1. a. 1. Same; identical; very same; very. [Obsolete or archaic except when followed by *same*. See *selfsame*.]

Chaucer, Franklin's Tale, l. 666.

To shoot another arrow that self way  
Which you did shoot the first.

Chaucer, Man of Law's Tale, l. 17.

Who . . . by self and violent hands  
Took off her life.

Shak., Macbeth, v. 8. 70.

## 3. Single; simple; plain; unmixed with any other: particularly noting colors: as, self-colored.

The patterns, large bold scrolls, plain and embossed,  
generally in blue, upon a self-drab ground.

J. Arrowsmith, Paper-Hanger's Companion, p. 82.

II. *pron.* A pronominal element affixed to certain personal pronouns and pronominal adjectives to express emphasis or distinction, or to denote a reflexive use. Thus, for emphasis, *I myself* will write; *I will examine for myself*; *thou thyself* shalt go; *thou shalt see for thyself*; the writing *itself* shall be exhibited. "*I myself* will decide" not only expresses my determination to decide, but my determination that no other shall decide. Reflexively, *I abhor myself*; *he admires himself*; *it pleases itself*. *Himself*, *herself*, *themselves* are used in the nominative case as well as in the objective. When the elements are separated by an adjective, *self* becomes a mere noun: as, *my own self*, *our two selves*, *his very self*; so *one's self* for *oneself*. See III.

Now chese yourselven whether that you liketh.

Chaucer, Wife of Bath's Tale, l. 371.

Jesus himself baptized not, but his disciples. John iv. 2.

III. *n.*; pl. *selves* (*selvz*). 1. A person in his relations to that very same person. *Self* differs from *ego* as being always relative to a particular individual, and as referring to that person in all his relations to himself and not merely as given in consciousness.

So they loved, as love in twain  
Had the essence but in one;  
Two distincts, division none; . . .  
Property (individuality) was thus appalled,  
That the self was not the same.  
Single nature's double name  
Neither two nor one was called.

Shak., Phoenix and Turtle, l. 88.

*Self* is that conscious thinking thing . . . which is sensible or conscious of pleasure and pain, capable of happiness or misery.

Locke, Human Understanding, II. xxvii. 17.

The best way of separating a man's self from the world is to give up the desire of being known to it.

Steele, Spectator, No. 264.

The consciousness of *Self* involves a stream of thought, each part of which as 'I' can (1) remember those which went before, and know the things they knew; and (2) emphasize and care paramountly for certain ones among them as 'me,' and appropriate to these the rest.

W. James, Prin. of Psychology, l. 400.

2. A thing or class of things, or an attribute or other abstraction, considered as precisely distinguished from all others: as, the separation of church and state is urged in the interest of religion's *self*.

Nectar's self grows loathsome to them.

Burton, Anat. of Mel., p. 355.

## 3. Personal interest and benefit; one's own private advantage.

The circle of his views might be more or less expanded, but *self* was the steady, unchangeable centre.

Prescott, Ferd. and Is., II. 24.

Love took up the harp of Life, and smote on all the chords with might:

Smote the chord of *Self*, that, trembling, pass'd in music out of sight.

Tennyson, Locksley Hall.

4. In *hort.*, a flower with its natural plain color; a self-colored flower, as distinguished from one which has become "rectified" or variegated. Compare *self-colored*. (*Self* is the first element in numerous compounds, nearly all modern. It may be used with any noun having an associated verb, or with any participial adjective (in *-ing* or *-ed* or *-en*), or other adjective implying action. It indicates either the agent or the object of the action expressed by the word with which it is joined, or the person on behalf of whom it is performed, or the person or thing to, for, or toward whom or which a quality, attribute, or feeling expressed by the following word belongs, is directed, or is exerted, or from which it proceeds; or the subject of, or object affected by, such action, quality, attribute, feeling, and the like; and the meaning is frequently negative, implying that the relation exists toward self only, not toward others: as, *self-acting*, etc. Most of these compounds are of obvious meaning; only the more important of them are given below (without etymology, except when of early formation). In words compounded with *self*, the element *self* has a certain degree of independent accent, generally less than that of the following element, but liable to become by emphasis greater than the latter.] — *By one's self*. See *by*. — *To be beside one's self*. See *beside*. — *To be one's self*, to be in full possession of one's powers, both mental and physical.

*self-abandonment* (self-a-ban'don-ment), *n.* Disregard of self or of self-interest.

=Syn. *Self-denial, Self-sacrifice, Austerity, Asceticism, self-abnegation, self-forgetfulness.* The italicized words agree in representing the voluntary refusal or surrender of personal comfort or desires. *Self-denial* is to be presumed wise, necessary, or benevolent, unless indication is given to the contrary; it may be the denial of selfishness; it may be not only the refusal to take what one might have, but the voluntary surrender of what one has; it may be an act, a habit, or a principle. *Self-sacrifice* goes beyond *self-denial* in necessarily including the idea of surrender, as of comfort, inclination, time, health, while being also presumably in the line of a real duty. The definition of *austerity* is implied in that of *austere* in the comparison under *austere*; it stands just at the edge of that frame of mind which regards *self-denial* as good for its own sake; it pushes simplicity of living and the refusal of pleasure beyond what is deemed necessary or helpful to right living by the great mass of those who are equally earnest with the austere in trying to live rightly. *Asceticism* goes beyond *austerity*, being more manifestly excessive and more clearly delighting in self-mortification as a good in itself; it also generally includes somewhat of the disposition to retire from the world.

Not only is the phrase *self-love* used as synonymous with the desire of happiness, but it is often confounded . . . with the word *selfishness*, which certainly, in strict propriety, denotes a very different disposition of mind.

D. Stewart, Philos. of Active and Moral Powers, ff. 1.

The mention of *Selfishness* leads me to remind you not to confound that with *Self-love*, which is quite a different thing. *Self-love* is . . . a rational, deliberate desire for our own welfare; and for anything we consider likely to promote it. *Selfishness*, on the other hand, consists not in the indulging of this or that particular propensity, but in disregarding, for the sake of any kind of personal gratification or advantage, the rights or the feelings of other men.

An assembly or council of citizens invested with a share in the government of a state. Especially—(a) In ancient Rome, a body of citizens appointed or elected from among the patricians, and later from among rich plebeians also, or taking seats by virtue of holding or of having held certain high offices of state. Originally the senate had supreme authority in religious matters, much legislative and judicial power, the management of foreign affairs, etc. At the close of the republic, however, and under the empire, the authority of the senate was little more than nominal apart from certain administrative functions, chiefly fiscal, and from its sittings as a high court of justice and as an appellate tribunal. The original senate of the patricians numbered 100; after the adjunction of the tribes *Titius* or *Sabines* and *Luceres*, the number became 300, and remained at this figure for several centuries, with the exception of some temporary changes, until the supremacy of Sulla. Julius Caesar made the number 900, and after his death it became over 1,000, but was reduced to 600 by Augustus, and varied under subsequent emperors. (b) The upper or less numerous branch of a legislature in various countries, as in France, Italy, the United States, and in all the separate States of the Union. The Senate of the United States consists of two senators from each State, and numbers (in 1902) 90 members. A senator must be at least thirty years of age, nine years a citizen of the country, and a resident of the State from which he is chosen. Senators are elected by the State legislatures, and sit for six years, but the terms of office are so arranged that one third of the members retire every two years. In addition to its legislative functions, the Senate has power to confirm or reject nominations and treaties made by the President, and also tries impeachments. The vice-president of the United States is the president of the Senate; in his absence a senator is chosen president pro tempore. The upper house of the Canadian Parliament is also called the Senate; its 81 members are appointed by the crown for life. Hence—(c) In general, a legislative body; a state council; the legislative department of a government.

1. A genus of composite plants, type of the tribe *Senecionidez* and subtribe *Euseneceionez*. It is characterized by terminal flower-heads with a broad or cylindrical involucre of one or two rows of narrow bracts, numerous regular and perfect disk-flowers with truncate and cylindrical recurved style-branches and nearly cylindrical five- to ten-ribbed achenes, smooth or but slightly downy, and little or not at all contracted at the summit, which bears a copious soft white pappus of slender simple bristles. Some species have flower-heads calyculate with a few bractlets below, and the majority bear spreading pistillate rays, which are, however, minute in some and in others absent. This has been esteemed the largest genus of flowering plants, containing (including *Cacalia*, with Durand, 1888) at least 960 clearly distinct species; it is yet uncertain whether or not it is surpassed by the leguminous genus *Astragalus*, under which 1,300 species have been described, but perhaps not over 900 of these are genuine. The species of *Senecio* are mostly herbs, of polymorphous habit, either smooth or woolly, and bear alternate or radical leaves which are entire, toothed, or dissected. Their flower-heads are either large or small, corymbed, panicle, or solitary, and are in the great majority of species yellow, especially the disk-flowers. The genus is of almost universal distribution, but the range of individual species is remarkably limited. They are most abundant in temperate climates; probably about two thirds of the species belong to the Old World, and of these half to South Africa and over a fourth to Europe and the Mediterranean region. About 66 species are found in the United States, including the 9 species of *Cacalia* (Tournefort, 1700), separated by many authors; the others are chiefly low or slender herbs with bright-yellow rays, most numerous in the central States. American species are much more abundant in the Andean region, where they assume a shrubby habit and in three fourths of the species develop no ray-flowers, the reverse of the proportion elsewhere. Many of the Andean species grow close to the snow-line, and have leaves quite glossy and glutinous above and clothed with warm wool beneath; some gummy-leaved species have been used for firewood by the Bolivians under the name *tolu*. In St. Helena and New Zealand a number of species become small trees. (See *he-cabbagetree* and *puka-puka*.) (For the principal British and American species, see *ragwort*, *kiferoot*, and *jacobaea*; for the original species, *S. vulgaris*, a weed sold for cage-birds in London under the names *bird-seed* and *chickenweed*, and also called *sencion* and *simson*, see *groundsel*.) Several species have been in repute as remedies for wounds, as *S. Sarcocornia* (for which see *Sarcocornia confren*, under *Sarcocornia*). *S. paludosus* is known as *bird's-tongue*, *S. hieracifolius* as *hawkweed*, and *S. Lyallii*, of New Zealand, as *mountain-marigold*. *S. lobatus*, a tall and rather showy species of the southern United States, is known as *butterweed*, from its fleshy leaves. *S. Cineraria*, a bushy yellow-flowered perennial of Mediterranean shores from Spain to Greece and Egypt, is the dusty-miller of gardens, valued for its numerous long and pinnately cleft leaves, remarkably whitened with

close down; from it the native dusty-miller of the Atlantic coast, *Artemisia Stelleriana*, is distinguished by its short, roundish, less deeply cut leaves. *S. mikanioides*, Cape ivy, a tender climber with smooth and shining bright-green angled leaves, from the Cape of Good Hope, is a favorite in cultivation. Several species are cultivated for their flowers under the generic name *Senecio*, as the orange *S. Japonicus*, and the purple and yellow *S. pulcher*, which reach nearly or quite 3 inches in diameter. *S. argenteus*, the silvery senecio, a dwarf 2 inches high, is valued for edgings, and several others for rock-gardens. The most important species, perhaps, are those of the section *Cineraria*, cultivated under glass, some of which have deep-blue rays, a color elsewhere absent from this genus as from most other composite genera.

They are mainly annual and perennial herbs with alternate leaves and yellow disk-flowers, often also with yellow rays. II. *n.* [*l. c.*] A dealers' name of the small African blood-finches of the genus *Lagonosticta*. They are tiny birds, averaging under 4 inches long, and would be taken for little finches, but belong to the spermistene group of the *Ploceidæ* (not to *Fringillidæ*). More than 20 species of *Lagonosticta* are described, all African; they are closely related to the numerous species of *Spermestes*, all likewise African, and of *Estrela* and its subdivisions, mainly African, but also Indian, some of which are known to the dealers as *amadavats*, *strawberry-finches*, etc. The blood-finches (*Lagonosticta* proper) are so called from their leading color, a rich crimson, shaded into browns, grays, and black, and often set off with pearly white spots. Several different birds share the name *senegal*. That to which it specially pertains inhabits Senegambia; it is the *senegals* of the early French and the *fire-bird* or *fire-finch* of the early English ornithologists, the *Fringilla senegala* of Linnaeus, and the *Estrela senegala* of many writers; it is 3½ inches long, the male mostly crimson, with black tail and brown belly, and the back brown washed over with crimson. *L. minima* is scarcely different, but slightly smaller, and has a few white dots on the sides of the breast.

**sensation** (sen-sā'shon), *n.* [*OF. sensation*, *F. sensation* = *Pr. sensation* = *Sp. sensación* = *Pg. sensação* = *It. sensazione*, < *ML. \*sensatio(n)-*, < *L. sensatus*, endowed with sense: see *sensate*.] 1. The action, faculty, or immediate mental result of receiving a mental impression from any affection of the bodily organism; sensitive apprehension; corporeal feeling; any feeling; also, the elements of feeling or immediate consciousness and of consciousness of reaction in perception; the subjective element of perception.

*Sensation* has to be distinguished from *feeling* on the one hand, and from *perception* on the other. All are abstractions, or objects segregated by the mind from their concomitants, but perception is less so and feeling more so than sensation. Sensation is feeling together with the direct consciousness of that feeling forcing itself upon us, so that it involves the essential element of the conception of an object; but sensation is considered apart from its union with associated sensations, by which a perception is built up. Sensations are either peripheral or visceral. Among the latter are to be specially mentioned sensations of operations in the brain. No approach to a satisfactory enumeration of the different kinds of sensations, even of the peripheral kind, has been made.

Those that make motion and sensation thus really the same, they must of necessity acknowledge that no longer motion, no longer sensation, . . . and that every motion or reaction must be a new sensation, as well as every ceasing of reaction a ceasing of sensation.

*Dr. H. More*, *Immortal*, of *Soul*, II, I, 12.

The perception which actually accompanies and is annexed to any impression on the body made by an external object, being distinct from all other modifications of thinking, furnishes the mind with a distinct idea, which we call *sensation*.

*Locke*, *Human Understanding*, II, xix, 1.

*Sensation*, so long as we take the analytic point of view, differs from perception only in the extreme simplicity of its object or content. . . . From the physiological point of view both sensations and perceptions differ from thoughts in the fact that nerve-currents coming in from the periphery are involved in their production.

*W. James*, *Prin. of Psychology*, xvii.

Impressions may be divided into two kinds, those of sensation and those of reflexion. The first kind arises in the soul originally, from unknown causes.

*Hume*, *Treatise of Human Nature*, I, ii.

The feelings which accompany the exercise of these sensitive or corporeal powers, whether cognitive or appetent, will constitute a distinct class, and to these we

may with great propriety give the name of *sensations*; whereas on the feelings which accompany the energies of all our higher powers of mind we may with equal propriety bestow the name of *sentiments*.

*Sir W. Hamilton*, *Metaph.*, xlv.

Unlucky Welsted! thy unfeeling master,  
The more thou ticklest, gripes his fist the faster.  
While thus each hand promotes the pleasing pain,  
And quick sensations skip from vein to vein.

Possessing or characterized by sense, judgment, or reason; endowed with or characterized by good or common sense; intelligent; reasonable; judicious: as, a sensible man; a sensible proposal.**

Be Sensible, Be Conscious, etc.** See *feel*¹.—**5 and 7. Sensible, Sensitive, Sentient.** *Sensible* in its first meaning was passive, but is now quite as often active. As active, it is both physical and mental, and is unemphatic: as, to be *sensible* (that is, aware) of heat or cold, of neglect or injury. *Sensitive* means feeling acutely, either in body or in mind. A *sensible* man will school himself not to be too *sensitive* to criticism. *Sentient* is a physiologically descriptive word, indicating the possession or use of the sense of feeling: as, the fly is a *sentient* being.—**6. Sensible, Judicious, discreet, sage, sagacious, sound.** As compared with *judicious*, *sensible* means possessing common sense, having a sound and practical reason, while *judicious* means discreet in choosing what to do or advise; the one applying to the understanding and judgment, the other to the judgment in its relation to the will. *Sensible, Intelligent, Common-sense.* As compared with *intelligent*, *sensible* means possessed of the power to see things in their true light, the light of a correct judgment, a large, sound, roundabout sense, while *intelligent* means possessed of a clear and quick understanding, so as to apprehend an idea promptly and see it in its true relations. The relation between cause and effect is here so close that *intelligent* often seems to mean essentially the same as *well-informed*. Where the sense implied in *sensible* is thought of as peculiarly general or level to the experience, conclusions, or notions of the mass of men, *common-sense* is, by a new usage, sometimes employed: as, he was a *common-sense* person: he took a *common-sense* view of the matter. All these words apply both to the person and to his opinions, words, writings, etc.

Practically this pary is only quart with the point lowered to protect the lower part of the body. Also *thrust or point in septime*—that is, defended by the pary called *septime*.

**septimole** (sep'ti-mōl), *n.* [*L. septem, seven (septimus, seventh), + -ole.*] In *music*, a group of seven notes to be played in the time of four or six of the same kind. It is indicated by the sign  $\frac{7}{4}$  placed over the group. Also *septole*.

A period of seventy days.—2. [*cap.*] The third Sunday before Lent: more fully called *Septuagesima Sunday*. The original history of this name and of *Sexagesima* (applied to the Sunday following) is not known; and any direct reference to sixty and seventy in these periods of sixty-three and fifty-six days before Easter is not to be traced. The probability is that the use of *Quadragesima Sunday* for the first Sunday in *Quadragesima* or Lent, and the independent use of *Quinquagesima* for the fiftieth day before Easter (both included), led to the extension of the series by the inexact application of the names *Sexagesima* and *Septuagesima* to the two Sundays preceding. Also called *Lost Sunday*, *Albion Sunday*, *See Sunday*.

**septuagesimal** (sep'tū-aj-es'i-mal), *a.* [*Septuagesima + -al.*] Consisting of seventy, es-

The Seventy—that is, the seventy (or more) persons who, according to the tradition, made a translation of the Hebrew Scriptures into Greek. The rounded legend is that the translation was made by seventy-two persons in seventy-two days. In another view, the Seventy were members of the sanhedrim (about seventy in number) who sanctioned the translation.

The *Septuagints* translation.

*Minsheu.*

2. A Greek version of the Hebrew Scriptures made by the Seventy (see *def. 1*): usually expressed by the symbol LXX ('the Seventy'). This version is said by Josephus to have been made in the reign and by the order of Ptolemy Philadelphus, King of Egypt, about 270 or 280 years before the birth of Christ. It is supposed, however, by modern critics that this version of the several books is the work, not only of different hands, but of separate times. It is probable that at first only the Pentateuch was translated, and the remaining books gradually; but the translation is believed to have been completed by the second century B. C. The Septuagint is written in the Hellenistic (Alexandrine) dialect, and is linguistically of great importance from its effect upon the diction of the New Testament, and as the source of a large part of the religious and theological vocabulary of the Greek fathers, and (through the Old Latin version of the Bible (see *Italo*) and the influence of this on the Vulgate) of that of the Latin fathers also and of all western nations to the present day. In the Greek Church the Septuagint has been in continuous use from the earliest times, although other Greek versions (see *Hexapla*) were anciently also in circulation, and it is the Old Testament still used in that church. The Septuagint contains the books called *Apocrypha* intermingled among the other books. It is the version out of which most of the citations in the New Testament from the Old are taken. Abbreviated *Sept.*

II. *a.* Pertaining to the Septuagint; contained in the Greek copy of the Old Testament.

**Septuagintal** (sep'tū-aj-in'tal), *a.* [*Septuagint + -al.*] Pertaining or relating to the Septuagint; contained in the Septuagint.

The *Septuagintal* tradition was at length set aside.

[*NL., dim. of L. septum, septum, a partition: see septum.*] A little septum or small partition.—*Septula renum*, inward prolongations of the cortical substance of the kidneys, extending between the pyramids as far as the sinus and bases of the papillae. Also called *columnæ Bertini* or *columns of Bertin*, and *cortical columns*.

It is found upon experiment that hydrogen goes through a septum or wall of graphite four times as fast as oxygen. *W. K. Clifford, Lectures*, I, 205.

Specifically—(a) In *bot.*, any kind of a partition, whether a proper dissepiment or not: as, the septum in a seed; the septum of a spore. (b) In *anat.* and *zool.*, a partition; a wall between two cavities, or a structure which divides a part or an organ into separate portions; a dissepiment. In vertebrates the formations known as *septa* are most frequently situated in the vertical longitudinal median line of the body, but may be transverse or otherwise disposed. A number of them are specified by qualifying words. See phrases following. (c) In *corals*, a calcified mesentery; one of the six or more vertical plates which converge from the wall to the axis of the visceral space, dividing this into a number of radiating loculi or compartments. Each septum appears single or simple, but is really a duplicate of closely apposed plates, just as the mesentery itself is a fold. They are to be distinguished from the horizontal dissepiments, or tabulae, which may cut them at right angles. They are variously modified in details of form, may be connected by synapticalae, and are divided, according to their formation, into *primary*, *secondary*, and *tertiary*. (d) In *conch.*, one of the transverse partitions which separate the cavity of the shell of a cephalopod into chambers. (e) In *vermes*, a sort of diaphragm, a series of which

Same as *falx cerebelli*.—*Septum cordis*, the partition between the right and left cavities of the heart.—*Septum crurale*, a layer of condensed areolar tissue which closes the femoral ring in man, serves as a barrier to the protrusion of a femoral hernia, and is perforated for the passage of lymphatics: badly so named by J. Cloquet, and better called *septum femorale*.—*Septum femorale*, the septum crurale. *H. Gray, Anat.* (ed. 1888).—*Septum linguae*, the partition of the tongue; a vertical median layer of fibrous tissue dividing the tongue into right and left halves. Also called *septum pellucidum, septum medium, septum ventriculorum, ventricular septum, septum medullare triangulare*. See *cut under corpus*.—*Septum narium*, the partition between the right and left nasal cavities or meatus of the nose. In man it is formed chiefly by the mesethmoid, or perpendicular plate of the ethmoid, the vomer, and the triangular cartilage of the nose.—*Septum nasi*. Same as *septum narium*. In zoology it is often restricted to the surface between the openings of the right and left nostrils, which may be of this or that character, deeply cleft as in the hare, hairy or naked, etc.—*Septum orbitale* or *orbitarium*, the orbital partition; any formation which separates the right and left eye-sockets. The term is less frequently used in relation to mammals, whose eyes are generally small and far apart, than among lower vertebrates, as birds, whose orbits are very large comparatively, and separated only by a thin vertical plate of bone, which may be perforated, or so far defective that the opposite orbits are thrown into one large cavity.—*Septum pectiniforme*, the pectinated septum of the penis, a median vertical partition between the right and left cavernous bodies of that organ. In man it is a dense, firm fibrous structure with many vertical slits, through which the blood-vessels of the opposite sides communicate freely, this comb-like appearance giving the name. It sometimes includes an ossification, the os penis or penis-bone, as in the dog, racoon, etc. Also called *septum penis*.—*Septum pontis*, the septum of the pons Varolii.—*Septum rectovaginale*, the wall which separates the rectal from the vaginal cavity.—*Septum scroti*, the partition between the right and left cavities of the scrotum.—*Septum sphenoidale*, the mesial partition between the sphenoidal sinuses.—*Septum transversum*, the diaphragm; the transverse partition between the thoracic and abdominal cavities.—*Septum ventriculorum*, or *ventricular septum*. lowing.

He who sees in the person of his Redeemer a fact more  
stupendous and more majestic than all those observed *se-  
quences* which men endow with an imaginary omni-  
potence, and worship under the name of Law—to him, at  
least, there will be neither difficulty nor hesitation in sup-  
posing that Christ . . . did utter his mandate, and that  
the wind and the sea obeyed.

*Farrar, Life of Christ, I. xliii.*

4. A series of things following in a certain or-

5. In *music*, a series of melodic or harmonic  
phrases or groups repeated three or more times  
at successive pitches upward or downward,  
usually without modulation or chromatic deviation  
from the key. The interval between the repeti-  
tions may be uniformly a half-step, a whole step, or even  
a longer interval, or it may vary diatonically between a  
step and a half-step. When the repetition is precise, inter-  
val for interval, the sequence is called *exact, real, or  
chromatic*; when it uses only the tones of the key, it is  
*tonal or diatonic*. Compare *roalia*. Also called *progres-  
sion* and *sequentia*.

as used in this part of the liturgy. In medieval times a  
great number of *sequences* were in use, and a different  
selection of them in different places. At present in the  
Roman Catholic Church only four are retained.

(Endlicher, 1847), named from *Sequoia*, *Sequo* Yah (also called George Guess), an Indian of the Cherokee tribe, who invented an alphabet and taught it to his tribe.] A genus of coniferous trees, of the tribe *Abietinæ* and subtribe *Taxodinae*. It is characterized by an oval cone, with persistent woody scales each bearing about five ovules, and dilated upward in fruit into a rhomboidal wrinkled and flattened slightly prickly-tip.

Part of one of the Big Trees (*Sequoia gigantea*), Mariposa Grove, California. (Diameter, 30 feet.)

ped apex. The flowers are monocious, terminal or axillary on young shoots, with their scales spirally set. The small and involucre staminate flower consists of an oblong column of united stamens, bearing crowded ovate connective scales, each with three to five anthers. The compressed seed bears a thick spongy margin, and contains four to six seed-leaves. There are but two species, both Californian, and ranking among the most remarkable of trees, growing straight, tall, and columnar, with short densely spreading branches, soft red wood, and very thick fibrous and spongy bark. They bear acute, compressed, and keeled decurrent narrow leaves, which are alternate and spirally inserted, or spread in two ranks on the younger branches. Their small cones ripen in the second year. For *S. sempervirens*, discovered by Menzies about 1794, see *redwood*. The other species, *S. gigantea*, by some formerly separated as a genus, *Washingtonia* (Winslow, 1854), and the *Wellingtonia* of English gardens, is the mammoth tree or big tree of California. It is a less graceful tree, with shorter branches, pendulous branchlets, paler appressed leaves, its wood a duller red, with thin white sapwood, its bark near the ground 1 to 2 feet thick, and its cones much larger (2 or 3 inches long). It forms a series of forests in Tulare county, California, isolated groves extending 260 miles northward, and it has been recently reported from southern Oregon. The tallest tree now known, one of the Calaveras grove, is 325 feet high; one in the King's River forest is 35 feet 8 inches in diameter inside the bark 4 feet from the ground, and its age is estimated at over 4,000 years. Both species were early classed under *Taxodium* (which see), their nearest American living relative; a closer ally, however, is *Athrotaxis* (Don, 1839), a genus of three Tasmanian trees distinguished by a cone with mucronate or umbonate scales; their other living relatives are a few distant and mostly monotypic genera of Japan and China. (Compare *Taxodine*.) A very large number of fossil species are known with certainty, showing that the genus was much more abundant in late Cretaceous and Tertiary time than at present.

A villain; one of those who in the middle ages were incapable of holding property, were attached to the land and transferred with it, and were subject to feudal services of the most menial description; in *early Eng. hist.*, one who was not free, but by reason of being allowed to have an interest in the cultivation of the soil, and a portion of time to labor for himself, had attained a status superior to that of a slave.

The slave, indeed, still remained [in the fourteenth century], though the number of pure *serfs* bore a small proportion to the other cultivators of the soil. . . . But even this class had now acquired definite rights of its own; and, although we still find instances of the sale of *serfs* "with their litter," or family, apart from the land they tilled, yet, in the bulk of cases, the amount of service due from the *serf* had become limited by custom, and, on its due rendering, his holding was practically as secure as that of the freest tenant on the estate.

J. R. Green, *Short Hist. of Eng. People*, v. § 4.

The *serf* was bound to the soil, had fixed domestic relations, and participated in the religious life of the society; and the tendency of all his circumstances, as well as of

*Encyc. Brit.*, XXI. 102.

3. Figuratively, an oppressed person; a menial. = *Syn. Serf, Slave*. The *serf* is, in strictness, attached to the soil, and goes with it in all sales or leases. In *chem.*, a number of elements or compounds which have certain common properties and relations, or which exhibit, when arranged in orderly succession, a constant difference from member to member. Thus, the elements lithium, sodium, potassium, rubidium, and cesium form a natural series having the familiar properties of the alkalis, and certain striking physical relations to the other elements. The hydrocarbons methane (CH<sub>4</sub>), ethane (C<sub>2</sub>H<sub>6</sub>), propane (C<sub>3</sub>H<sub>8</sub>), etc., form a series having the constant difference CH<sub>2</sub> between successive members, but all the members having in common great chemical stability, slight reactive properties, and incapacity to unite directly with any element or radical.

4. In *numis.*, a set of coins made at any one place or time, or issued by any one sovereign or government.

7. In *systematic bot.*, according to Gray, the first group below *kingdom* and the next above *class*: equivalent to *subkingdom* or *division* (which see). In actual usage, however, this rule is by no means always observed. In Bentham and Hooker's "Genera" it is a group of cohorts with two stages between it and *kingdom*; and in the same and other good works it may be found denoting the first subdivision of an order, a tribe, a subtribe, a genus, and doubtless still other groups. It appears, however, always to mark a comprehensive and not very strongly accentuated division.

8. In *zool.*, a number of genera in a family, of families in an order, etc.; a section or division of a taxonomic group, containing two or more groups of a lower grade: loosely and variably used, like *grade*, *group*, *cohort*, *phalanx*, etc.—9. Abbreviated *ser.*—**Abel's series**, the series

P. Fletcher, Purple Island, ll. 9.

**II. n.** 1. A scaly creature that crawls on the belly; a limbless reptile; properly, a snake; any member of the order *Ophidia* (which see for technical characters). *Serpent* and *snake* now mean precisely the same thing; but the word *serpent* is somewhat more formal or technical than *snake*, so that it seldom applies to the limbless lizards, many of which are popularly mistaken for and called snakes, and *snake* had originally a specific meaning. (*see snake*) Serpents are found all over the world, except in very cold regions. Most of them are timid, inoffensive, and defenseless animals; others are among the most dangerous and deadly of all creatures. Some are very powerful, in consequence of their great size and faculty of constriction, as boas, pythons, and anacondas. Those which are not venomous are known as *innocuous* serpents, or *lanceas*; those which are poisonous are *noxious* serpents, or *Nocua*, sometimes collectively called *Thanatophidia*. All are carnivorous; and most are

able by means of their diastole mouths and the general distensibility of their bodies to swallow and digest their prey much than themselves. In cold and temperate countries serpents hibernate in a state of torpor. They are oviparous or ovoviviparous, and in some cases the young take refuge from danger by crawling into the girdle of the mother, whence the common belief that snakes swallow their young. Most serpents are tame, and at times are handled gently, by handling; others, as the cobra of India, are almost domestic; but the more venomous kinds can be safely handled only when the fangs have been removed. There is a very general misapprehension respecting the comparative numbers of venomous and harmless serpents. Out of more than 300 genera of ophidians, only about 50, or one sixth, are poisonous, and more than half of these belong to the two families *Najidae* and *Crotalidae* (the cobra and the rattlesnake families). The true vipers (*Viperidae*) and the sea-serpents (*Hydrophidae*), all venomous, have six or eight genera apiece; and four other venomous families have but one to three genera apiece. The proportion of venomous to non-venomous species is still smaller than that of the genera, as the latter will average more species to a genus than the former. Poisonous serpents are mainly confined to tropical and warm temperate countries; they are more numerous and diversified in the Old World than in the New, and rather more forms are *Proteroglypha* than *Solenoglypha* (see these words). Serpents large enough to be formidable from their powers of constriction belong to the *Boidae* and *Pythonidae*. A few families contain very small species, worm-like in appearance and to some extent in habits. A majority of all serpents belong to one family, the harmless *Colubridae*. See cuts under the various popular and technical names.

2. [cap.] In *astron.*, a constellation in the northern hemisphere. See *Ophiuchus*.—3. A musical instrument, properly of the trumpet family, having a cupped mouthpiece, a conical wooden tube bent to and fro several times and usually covered with leather, and nine finger-holes very irregularly disposed. Its compass extended from two to four octaves upward from about the third C below middle C, and included more or less diatonic and chromatic tones according to the skill of the performer. Its tone was pervasive, though somewhat harsh. It is said to have been invented by a canon of Auxerre in 1590 for use in church music. It was retained in orchestras until the invention of the contrabassoon, and is still occasionally used in French churches.

4. A hydrous silicate of magnesium, occurring massive, sometimes fine, granular, and compact, again finely fibrous, less often slaty. It is usually green in color, but of many different shades, also red, brown, or gray, sometimes with spots resembling a serpent's skin. There are numerous varieties, differing in structure and color. The most important of these are—precious or noble serpentine, under which term are comprised the more or less translucent serpentines, having a rich oil-green color; foliated varieties, including marmolite and antigorite; fibrous varieties, as chrysotile (sometimes called *serpentine asbestos*) and metachrys. Other minerals more or less closely allied to or identical with serpentine are picrolite, williamsite, bowenite, retinite, baltimorite, vorhausite, hydrophile, jenkinsite, villarsite, etc. Serpentine occurs widely distributed and in abundance, forming rock-masses, many of which were formerly regarded as being of eruptive origin, but which are now generally conceded to have been formed by the metamorphism of various rocks and minerals; indeed, it has not been proved that serpentine has ever been formed in any other way than this. The peridotites appear to have been peculiarly liable to this kind of alteration, or serpentinization, as it is called. Massive serpentine has been extensively used for both interior and exterior architectural and decorative purposes, but in only a few localities is a material quarried which stands outdoor exposure without soon losing its polish, and eventually becoming disintegrated. The serpentinous rock commonly called *verd-antique*, and known to lithologists as *ophicalcite*, is a very beautiful decorative material, and has been extensively employed for ornament in various parts of the world. See *verd-antique*.

These tubes are so solid as to resemble the shells of some mollusks, and are closed by an operculum formed by a shelly plate on one of the tentacles. They are in general beautifully colored. The largest are found in tropical seas.

**Serranidæ** (se-ran'i-dē), *n. pl.* [*NL. (Richardson, 1848), < Serranus + -idæ.*] A family of

acanthopterygian fishes, typified by the genus *Serranus*, related to the *Percidæ* and by most ichthyologists united with that family, and containing about 40 genera and 300 species of carnivorous fishes of all warm seas, many of them known as *groupers*, *sea-basses*, *rock-fish*, etc.

(a) By Sir John Richardson, the name was applied in a vague and irregular manner, but his family included all the true *Serranidæ* of recent ichthyologists. (b) By Jordan and Gilbert, the name was applied to all acanthopterygians with the ventral fins thoracic and perfect, the lower pharyngeal bones separate, scales well developed, pectoral fins entire, skull not especially cavernous, maxillary not sloping under the preorbital for its whole length, mouth nearly horizontal, and anal fin rather short. The family thus included the *Centropomidæ* and *Rhyttididæ*, as well as true *Serranidæ*.

(c) In Gill's system, the name was restricted to serranoids with the body oblong and compressed and covered with scales, the head compressed and the cranium normal, the supramaxillaries not retractile behind under the suborbitals, the spinous part of the dorsal fin about as long as the soft or longer, and three anal spines developed. The family as thus restricted includes about 300 fishes, which chiefly inhabit the tropical seas; but a considerable contingent live in the temperate seas. It includes many valuable food-fishes. The jewfish or black sea-bass is *Stereolepis gigas*; the stone-bass is *Polygion cornutum*. The *groupers* or *garrupas* are fishes of this family, of the genera *Epinephelus* and *Triptoplia*. The maxillary is not supplemented with another bone, and the lateral canines are stronger than those in front. The type of the genus is the Mediterranean *S. scriba*. *S. cabrilla* is a British species.

Among American species related and by some referred to *Serranus* may be noted *Centropomus atrarius*, the black sea-bass or blackfish, from Cape Cod to Florida, 12 inches long; the squirrel-fish or serrano, *Diplastrum fasciculare*, West Indies to South Carolina; *Paralichthys citharus*, the rock-bass or cabrilla of California, attaining a length of 18 inches; and *P. nebulifer*, the Johnny Verde of the same region. They have a compressed high body, with the belly sharply compressed and the scales developed to give a serrated appearance to the branchial apertures wide; the branchial membrane deeply incised, and free below; the dorsal fin elongated, and an adipose fin. The teeth are well developed and mostly trenchant. The species are characteristic of the fresh waters of tropical South America. Among them are some of the most dreaded and carnivorous of fishes. By means of their sharp teeth they are enabled to cut the flesh of animals as with a pair of scissors, and where they are found it is impossible for an animal to go into the water without danger. They are attracted by the smell of blood, and congregate from considerable distances to any spot where blood has been spilt. They are best known by the name of *caribe*. Many species have been

The phrase is sometimes restricted to the interfrontal suture, the sagittal being called *dentate*, and the coronal *limbose*, but the difference is slight, if any, and holds for few animals besides man. See cuts under *cranium* and *parietal*.—*Serrate tibiae*, in entom., tibiae which have a row of sharp teeth along the greater part of the outer edge, as in the *Scolytidae*.—*Serrate unguis*, in entom., unguis or claws having a row of sharp teeth on the lower edge. One who serves or attends, whether voluntarily or involuntarily; a person employed by another, and subject to his orders; one who exerts himself or herself, or labors, for the benefit of a master or an employer; an attendant; a subordinate assistant; an agent. The earlier uses of this word seem to imply protection on the part of the sovereign, lord, or master, and the notion of clientage, the relation involved being one in no sense degrading to the inferior. In modern use it denotes specifically a domestic or menial helper. (See (c), below.) In law a servant is a person who, for a consideration, is bound to render service under the legal authority of another, such other being called the *master*. Agents of various kinds are sometimes included in the general designation of *servants*; but the term *agent* implies discretionary power, and responsibility in the mode of performing duty, such as is not usually implied in the term *servant*: as, the uniformed *servants* of a railway-company. —7. In law, the burden of an easement, the condition of a tenement which is subject to some right of enjoyment by another than the owner of the tenement, in virtue of his ownership of another tenement. (See *easement*.) In Roman law, a right to use or deal with, in a given and definite manner, a thing belonging to another. As to real estate, it is nearly equivalent or correlative to the easement of the common law, except that it also embraces rights to take the fruits of the servient estate, which in English law are not called *easements*, but *profits à prendre*.—Affirmative *servitude*. See *negative-servitude*, below.—Discontinuous *servitude*, in law, an easement which consists in the right to perform a series of distinct acts, as a right of way or of common, or the servitude answering thereto, such as cannot be enjoyed but by the intervention of man: distinguished from a continuous *servitude*, which consists in a constant servitude, or in the reservation of some characteristic of the servient tenement, as a right of view or a right to a watercourse.—Negative *servitude*, a servitude or easement which consists in the right merely to restrict the enjoyment of the owner of the servient tenement, as distinguished from one which entitles one to do an act which without the existence of the easement would be a positive wrong to the owner of that tenement. Thus, the right to receive light and air by windows over the land of another is a negative *servitude*, whereas the right to discharge water upon the land of another is an affirmative *servitude*.—Personal *servitude*, a right constituted over a subject in favor of a person, without reference to possession or property.—Fiducial *servitude*, a right constituted over one subject or tenement enjoyed by the owner of another subject or tenement. Fiducial *servitudes* are either rural or urban, according as they affect land or houses. The usual rural *servitudes* are passage or road, or the right which a person has to pass over another's land; pasture, or the right to send cattle to graze on another's land; fall and divot, or the right to cut turf and peats on another's land; aqueduct, or the right to have a stream of water conveyed through another's land; thirlage, or the right to have other people's corn sent to one's own mill to be ground. Urban *servitudes* consist chiefly in the right to use a party-wall, or a common drain, or to have the rain from one's roof drop on another's land or house; the right to prevent another from building so as to obstruct the windows of one's house; the right of the owner of a flat above to have his flat supported by the flat beneath, etc.—*Syn.* 1. *Servitudo*, thraldom, vassalage, peonage.—1 and 3. *Servitudo*, *Slavery, Bondage*. These words express involuntary subjection, and are in the order of strength. *Servitudo* is the general word, its application to voluntary service being obsolete. *Slavery* emphasizes the completeness and the degradation of the state. *Bondage*, literally the state of being bound, is used chiefly in elevated style or figurative senses: as, *bondage* to appetite; Egyptian *bondage*. *Servitudo* is the only one of these words that applies to compulsory and unpaid service required as a legal penalty: the phrase *penal servitude* is very common. See *serv* and *captivity*.

The act of sitting, or the state of being seated: now rare except in the specific theological sense of Christ's sitting or enthronement at the right hand of God the Father. Also *assession*.

Christ . . . hath as Man, not as God only, supreme dominion over quick and dead, for so much his ascension into heaven and his *session* at the right hand of God do import.

3. The time, space, or term during which a court, council, legislature, or the like meets daily for business, or transacts business regularly without breaking up. Thus, a *session* of the legislature commonly means the period from its assembling to its adjournment for the year or season, in contradistinction to its *daily sessions* during that period. So a *session* of Parliament comprises the time from its meeting to its prorogation, of which there is in general but one in each year. Technically at common law it was held that a meeting of Parliament could not be called a *session* unless the sovereign passed an act. The *session* of a judicial court is called a *term*. Also applied in the United States to the daily or half-daily periods of work of a school.

During the twenty-five years of the York dynasty . . . the *sessions* of those parliaments which really met extended over a very few months. Stubbs, Const. Hist., §373.

The *sessions* of the Reichstag must be public; it is not within its choice to make them private. A private *session* is regarded as, legally, only a private conference of the members of the Reichstag, and can have no public authority whatever. W. Wilson, State, §417.

4. *pl.* In law, a sitting of justices in court, originally, as in England, upon commission: as, the *sessions* of oyer and terminer. See *oyer*.

It has the power to admit and discipline members, regulate the times of service, and administer all the spiritual affairs of the local church, and is answerable for its acts to the presbytery. In the Established Church of Scotland it is specifically called the *kirk session* (which see, under *kirk*).

They sit in two divisions, the lord president and three ordinary lords forming the first division, and the lord justice-clerk and other three ordinary lords the second division. The first and second divisions form what is called the *inner house*. There are five permanent lords ordinary, each of whom holds a court, the courts of the lords ordinary forming what is called the *outer house*. The junior lord ordinary officiates in the bill-chamber during session. See *bill-chamber*.—**Court of Sessions**, **Court of General Sessions**, **Court of Special Sessions**, in the United States, local criminal courts whose jurisdiction does not generally extend to offenses of the highest grades.—**General session of the peace**, in Great Britain, a meeting of the justices held for the pur-

A *sestina* is a poem written neither in rhyme nor blank verse, but in so-called six-line stanzas, each one of which has to take the last word of the stanza preceding it, and twist it about into some new and fantastic meaning.

**Sesuvium** (sē-sū'vi-um), *n.* [*NL. (Linnaeus, 1762).*] A genus of apetalous plants, of the order *Ficoideae* and tribe *Aizoideae*. It is characterized by flowers with a five-lobed calyx, five or more stamens, and a three- to five-celled ovary with axillary capsule, numerous ovules, and a circumscissile capsule. There are 4 species, natives of tropical shores throughout the world. They are erect or prostrate branching and succulent herbs, sometimes slightly shrubby. They bear opposite, fleshy, linear or oblong leaves without distinct stipules, and with axillary, solitary or clustered, usually reddish or purplish flowers. They are known as *sea-purslane*. *S. Portulacastrum* is a widely diffused species, useful with others in binding sea-sands, and in western Asia eaten as a salad. See *purslane*.

In the sense 'sink,' as the sun or stars, it is partly of Scand. origin, *< Icel. refl. setask*, *set*, as the sun, etc. Many uses are highly idiomatic, the verb, like *put*, its nearest equivalent, and *do*, *make*, *get*, etc., having become of almost universal application, and taking its distinctive color from the context.] **I. trans.** 1. 5. In *law*: (a) The balancing or countervailing of one debt by another. (b) The claim of a debtor to have his debt extinguished in whole or in part by the application of a debt due from his creditor, or from one with whom his creditor is in privacy. Set-off is that right which exists between two persons each of whom, under an independent contract, owes an ascertained amount to the other, to set off their respective debts, by way of mutual deduction, so that the person to whom the larger debt is due shall recover the residue only after such deduction. (Kerr.) Set-off, counter-claim, and recoupment are terms often used indiscriminately. Counter-claim is more appropriate of any cross-demand on which the claimant might if he chose maintain an independent action, and on which, should he establish it as a cause of action, either in such independent action or by way of counter-claim when sued, he would be entitled to an affirmative judgment in his own favor for payment of the claim except so far as his adversary's claim might reduce or extinguish it. This use of the word distinguishes it from such claims as may be set off in favor of a person, which yet would not sustain an action by him, nor any affirmative judgment in his favor. Recoupment is appropriate only to designate a cross-demand considered as dependent on the concession of plaintiff's demand, subject to a right to cut down the amount recoverable by virtue of it. In these, which are the strict senses of the words, a recoupment only reduces plaintiff's demand, and leaves him to take judgment for what remains after the deduction; a set-off extinguishes the smaller of two independent demands and an equal amount of the larger, but may leave the residue of the latter unenforced; a counter-claim is one that may be established irrespective of the adversary's success or failure in establishing his claim, and, although subject to be reduced or extinguished by the adversary's success, may otherwise be enforced in the same action.

This astrological association explains the identification by Pythagoras of the number *seven* with the opportune time (*καρπός*), as well as the fact that light was called *seven* by the Pythagoreans. That they termed it "motherless" may be due to the "seven spirits" of the Chaldeans—that is, the planets—being called "fatherless and motherless." 'distinction,' < secare, divide, cut; see secant.* A less specific designation for 'sex' was *L. genus* = *Gr. γένος, sex, gender; see gender, genus.*] 1. The character of being either male or female; the anatomical and physiological distinction between male and female, evidenced by the physical character of their generative organs, and the part taken by each in the function of reproduction; gender, with reference to living organisms. Sex is properly predicable only of male or female, those organisms which are neither male nor female being sexless or neuter. But the two sexes are often combined in the same individual, then said to be hermaphrodite or monocious. Sex runs nearly throughout the animal kingdom, even down to the

protozoans with, however, the exception of the infusorian amphiprotites. In the lower forms of life, the sex is not profound and is scarcely attended to or organized by the organism. Among many of the lowest it is accompanied by marked differences of physical character, but in the higher animals, as well as in the plants, the distinction of the male sex is the more marked, and that of the female the generative organs, and the one sex by a testis or a pair of testes, and the other by an ovary or a homologous pair. In the case of procreation or begetting in the male, the spermatozoa to an ovum, the corresponding function in the female is the formation of an ovum by spermatogenesis, resulting in conception or impregnation. The organs by which this result is accomplished are extremely varied in physical character; and various organs which, in the male, either sex, besides those directly concerned in the reproductive act, are known as secondary sexual characters. See *gender, generation, reproduction*, and quotation from Buck under *sexuality*, 1.

3. Especially, the female sex; womankind, by way of emphasis; generally with the definite article.

4. In *bot.*, the character or structure of plants which corresponds to sex in animals, there being, except in the lowest orders, a clear differentiation of male and female elements. In flowering plants the male organ is the stamen, the female the pistil; in cryptogams different designations are used according to the class of plants, as antheridium, archegonium, etc. See *male*, 1, 2, and *n*. 2, *female*, 1, 2, and *n*. 2, and *Linnean system*, under *Linnean*. ing, for measuring the angular distance of two stars or other objects, or the altitude of a star above the horizon, the two images being brought into coincidence by reflection from the transmitting horizon-glass, lettered *b* in the figure. The frame of a sextant is generally made of brass, the arc *h* being graduated upon a slip of silver. The handle *a* is of wood. The mirrors *b* and *c* are of plate-glass, silvered. The horizon-glass *b* is, however, only half silvered, so that rays from the horizon or other direct object may enter the telescope *e*. This telescope is carried in the ring *d*, and is capable of being adjusted, once for all, by a linear motion perpendicular to the plane of the sextant, so as to receive proper proportions of light from the silvered and unsilvered parts of the horizon-glass. The figure does not show the colored glass shades which may be interposed behind the horizon-glass and between this and the index-glass *c*, upon which the light from one of the objects is first received, in order to make the contact of the images more distinct. This index-glass is attached to the movable arm *f*. The movable arm is clamped by the screw *i*, and is furnished with a tangent screw *j*. The arc is read by means of a vernier carried by the arm.

**sexual** (sek'shū-al), *a.* [= F. *sexe* = Sp. *sexe*, *sexe* = It. *sessuale*, *< L. sexualis*, *< seors* (*seors*), *sex*; see *sex*.] 1. Of or pertaining to sex or the sexes in general: as, sexual characteristics.—2. Distinctive of sex, whether male or female; peculiar to or characteristic of either sex; genital: as, sexual organs; the sexual system.—3. Of the two sexes; done by means of the two sexes; reproductive: as, sexual intercourse; sexual reproduction.—4. Peculiar to or affecting the sexes or organs of sex; venereal: as, sexual disease or malformation.—5. Having sex; sexed; separated into two sexes; monœcious: the opposite of *asexual*: as, a sexual animal.—Secondary sexual characters, some or any characteristics not immediately concerned in reproduction which one sex has and the other sex has not: any structural peculiarity, excepting the organs of generation, which distinguishes male from female. Thus, the hair on a man's face and breast, the antlers of the

deer, the train of the peacock or any other difference in the plumage of a bird between the male and the female, the scent-glands of any male, the claspers of a fish, and many other features are regarded as secondary sexual characters, and are concerned in sexual selection.—**Sexual affinity.** (a) The unconscious or instinctive attraction of one sex for the other, as exhibited by the preference or choice of any one individual, rather than of any other, of the opposite sex, as a matter of sexual selection. In man such selection is often called *elective affinity* (after Goethe). (b) Such degree of affinity between the sexes of different species as enables these species to interbreed or hybridize.—**Sexual dimorphism,** difference of form or of other zoological character in the members of either sex, but not of both sexes, of any animal. Thus, a species of cirripeds which has two kinds of males, or a species of butterflies whose females are of two sorts, exhibits sexual dimorphism. The term properly attaches to the adults of perfectly sexed animals, and not to the many instances of dimorphism among sexless or sexually immature organisms. Thus, the honey-bee is not a case of sexual dimorphism, as there is only one sort of perfect males (the drones) and one of perfect females (the queen), though the hive consists mostly of a third sort of bees (workers or undeveloped females). Sexual dimorphism is common among invertebrates, rare in the higher animals.—**Sexual method,** in bot., same as *sexual system* (b).—**Sexual organs,** organs immediately concerned in sexual intercourse or reproduction; the sexual system.—**Sexual reproduction,** reproduction in which both sexes concur; gamogenesis.—**Sexual selection.** See *selection*.—**Sexual system.** (a) In zool. and anat., the reproductive system; the sexual organs, collectively considered. **sexuality** (sek-sū-al'i-ti), *n.* [*< sexual + -ity.*] 1. The character of sex; the state of being sexual or sexed or having sex; the distinction between the sexes; sex in the abstract.

It was known even before the time of Linnaeus that certain plants produced two kinds of flowers, ordinary open, and minute closed ones; and this fact formerly gave rise to warm controversies about the *sexuality* of plants.

Darwin, *Different Forms of Flowers*, p. 310.

Sex is a term employed with two significances, which are often confused, but which it is indispensable to distinguish accurately. Originally sex was applied to the organism as a whole, in recognition of the differentiation of the reproductive function. Secondly, sex, together with the adjectives male and female, has been applied to the essential reproductive elements, ovum and spermatozoon, which it is the function of the sexual organisms (or organs) to produce. According to a strict biological definition *sexuality* is the characteristic of the male and female reproductive elements (gametoblasts), and sex of the individuals in which the reproductive elements arise. A man has sex, a spermatozoon *sexuality*.

Buck's *Handbook of Med. Sciences*, VI. 436.

2. Recognition of sexual relations. [Rare.]

You may . . . say again, as I have heard you say ere now, that the popular Christian paradise and hell are but a Pagan Olympus and Tartarus, as grossly material as Mahomet's, without the honest thoroughgoing *sexuality* which, you thought, made his notion logical and consistent.

The short end is weighted so as to serve as the counterpoise of a lever, and from the long end a bucket is suspended by a rope. The shadoof is extensively used in Egypt for lifting water from the Nile for irrigation. The worker dips the bucket in the river, and, aided by the counterpoise weight, empties it into a hole dug on the bank, from which a tunnel conducts the water to the lands to be irrigated. In the cut (see the following page) two shadoofs are shown, employed side by side.

3. Shade within defined limits; the dark figure or image projected by a body when it intercepts the light. In optics *shadow* may be defined as a portion of space from which light is shut off by an opaque body. Every opaque object on which light falls is accompanied with a shadow on the side opposite to the luminous body, and the shadow appears more intense in proportion as the illumination is stronger. An opaque object illuminated by the sun, or any other source of light which is not a single point, must have an infinite number of shadows, though these are not distinguishable from each other, and hence the shadow of such an opaque body received on a plane is always accompanied by a *penumbra*, or partial shadow, the complete shadow being called the *umbra*. See *penumbra*.

LG. (also D.) *schacht*, a shaft (in a mine), a particular use, appar. in allusion to its being straight and narrow, of *schacht*, a shaft or rod (as of a spear): see *shaft*<sup>1</sup>.] 1. In mining, a vertical or inclined excavation made in opening the ground for mining purposes. A shaft may be sunk vertically, without regard to the dip of the lode, or it may be sunk by an incline following the lode, either closely or approximately, according as its dip is more or less regular. When it is expected that extensive operations will be carried on, the shafts are usually sunk vertically, and connected with the lode at various depths by cross-drifts or levels. When, however, the dip of the lode is pretty uniform and its thickness considerable, all the shafts of the mine may be sunk upon it as inclines. This is the case with the largest mines on Lake Superior. Shafts have various forms, some being round, others oval; but the most common shape is rectangular. In large mines the shaft is usually divided into several compartments, one being used for the pumping-machinery, two or more for hoisting ore, and another for lowering heavy timbers. In the English coal-mines the shafts are mostly circular in section; in Belgium, polygonal; in the anthracite region of Pennsyl-

vania the winding shafts are always square or rectangular, and there the largest shafts have a length of from 44 to 52 feet, and a width of 10 or 12.

According to modern usage, the principal tone is sounded first, and receives the accent throughout; but in old music the reverse was the case. If the subsidiary tone is chromatically altered, this is indicated by a sharp or a flat added to the sign of the shake. A shake is usually concluded with a turn, and often preceded by a prefix of one or more tones; in the latter case it is said to be *prepared*. A shake occurring in two or three voice-parts at once is called *double* or *triple*. A succession of shakes is called a *chain*. 7. A crack or fissure in timber, produced during growth by strain of wind, sudden changes of temperature, or causes not well determined, or formed during seasoning. Nearly all exogenous woods are in some degree subject to this defect, which appears in several forms. Heart-shake is a fissure through the center or pith, slight or serious, in its simplest form running the length of the trunk in one plane, in some specimens twisted. Another cleft may cross at right angles. Star-shake consists of radial fissures, sometimes even reaching the circumference. Cup-shake consists of clefts between the concentric layers, occurring most often near the root. All these shakes are commonly called *wind-shakes*.

**2.** Am (is, are, was, etc.) to (do something specified by the infinitive): forming verb-phrases having the value of future and conditional tenses, and usually (and properly enough) called such. (a) *Shall* is used in direct assertion to form the first persons singular and plural of the future and future-perfect tenses, the second and third persons in these tenses being formed by *will*. In this connection *shall* simply foretells or declares what is about to take place: as, I *shall* go to town to-morrow; we *shall* spend the summer in Europe. The future tense of the verb *go* thus becomes

I <i>shall</i>	We <i>shall</i>
Thou <i>will</i> go.	You <i>will</i> go.
He <i>will</i>	They <i>will</i>

"The use of *shall* instead of *will* in the first person is probably due to the fact that the act thus announced as about to take place ensues from the duty or obligation arising outwardly but contemplated inwardly as proper, and consequently as now about to take place in virtue of a tacit act of the speaker's will. Should the will or resolution of the speaker intervene, or be prominent in his mind, then *will* would be the proper word to express the futurity of the act: thus, 'I *will* go' means 'I am determined to go,' 'I have made up my mind to go.' 'I *shall* go home this evening' announces a future event as settled by consideration outside of the speaker's self; 'I *will* go home this evening' announces a future event having both its cause and its accomplishment in the speaker's own mind." (Dr. Beard.) In indirect assertion *shall* may express mere futurity in the second and third persons: as, he says that he *shall* go; he said that he *should* go: in these sentences "he" refers to one and the same person, the one who "says." If it referred to any other person, *will* would be used and not *shall*.

That woman had to water her soup with her furtive tears, to sit of nights behind hearts and spades, and brood over her crushed hopes. If I contemplate that wretched old Niobe much longer, I *shall* begin to pity her.

T. Hughes, Tom Brown at Rugby, ii. 8.

George Eliot, Romola, xiv.

(b) In the second and third persons *shall* implies authority or control on the part of the speaker, and is used to express (1) promise: as, you *shall* receive your wages; (2) command: as, thou *shalt* not steal; (3) determination: as, you *shall* go.

So long as youth and thou are of one date.

(4) Certainty or inevitability as regards the future.

And if I die, no man *shall* pity me [that is, it is certain no man will pity me].

Shak., Rich. III., v. 3. 201.

(c) Interrogatively, *shall* or *will* is used according as the one or the other would be used in reply, and accordingly 'shall I go?' 'shall we go?' 'shall he go?' 'shall they go?' ask for direction, or refer the matter to the determination of the person asked—that is, 'shall I go?' anticipates the answer 'you shall go.'

Pan. But will you tell me? Shall I marry?

Trouil. Perhaps. *Urquhart*, tr. of Rabelais, iii. 36.

I was employ'd in passing to and fro,

About relieving of the sentinels:

Then how or which way *should* they first break in?

Shak., 1 Hen. VI., ii. 1. 71.

(d) After conditionals, such as *if* or *whether*, and after verbs expressing condition or supposition, *shall* expresses simple futurity in all persons, the idea of restraint or necessity involved originally in the word *shall* being excluded by the context—thus:

If (or we) <i>shall</i>	
If: Thou <i>shalt</i> , or you <i>shall</i>	say.
He (or they) <i>shall</i>	

If then we *shall* [that is, are to] shake off our slavish yoke, Imp out our drooping country's broken wing,  
Away with me!

*Shall*, like other auxiliaries, is often used with an ellipsis of the following infinitive.

Bunyan, Pilgrim's Progress, ii.

**3.** The past tense *should*, besides the uses in which it is merely the preterit of *shall*, as above, has acquired some peculiar uses of its own. In some of these uses *should* represents the past subjunctive, not the past indicative. It is not used to express simple past futurity, except in indirect speech: as, I said I *should* [was to] go; I arranged that he *should* [was to] go. *Should* is often used to give a modest or diffident tone to a statement, or to soften a statement from motives of delicacy or politeness: thus, 'I *should* not like to say how many there are' is much the same as 'I hardly like,' or 'I do not like,' etc. Similarly, 'it *should* seem' is often nearly the same as 'it seems.'

He is no suitor then? So it *should* seem.

B. Jonson.

*Should* was formerly sometimes used where we should now use *might*.

The scribansd Pharisees aspieden hym that thei *schulden* fynde cause whereof thei *schulden* accuse hym.

Wyclif, Luke vi. 7.

The distinctions in the uses of *shall* and *will* and of *should* and *would* are often so subtle, and depend so much upon the context or upon subjective conditions, that they are frequently missed by inaccurate speakers and writers, and often even by writers of the highest rank. There is a tendency in colloquial English to the exclusive use of *will* and (except after a conditional word) *would*. See *will*<sup>1</sup>.

Cesar *should* [would] be a beast without a heart

If he should stay at home to-day for fear.

Shak., J. C., ii. 2. 42.

one of the hop-clovers, *Trifolium minus*, a slender trail-  
ing species with small yellow heads, perhaps a variety of  
*T. procumbens*. It is in use in many counties of Ireland,

Trinity is uncertain. It has been variously supposed to  
be the common white clover, *T. repens* (which, however,  
is believed to be of late introduction in Ireland); the red  
clover, *T. pratense*; the wood-sorrel, *Oxalis Aceto sella*  
(locally called *shamrock* in England); and even the water-

**shark**<sup>1</sup> (shârk), *n.* [Not found in ME. (the ME. name therefor being *hound-fish*); usually de-

rived *< L. carcharus, < Gr. κάρχαρις*, a kind of shark, so called from its sharp teeth, *< κάρχαρος*, jagged (of teeth); cf. *κάρκινος*, a crab; Skt. *karkata*, a crab, *karkara*, hard. But the requisite OF. forms intermediate between E. *shark* and L. *carcharus* are not found, and it is not certain that the name was orig. applied to the fish; it may have been first used of a greedy man (see *shark*<sup>2</sup>).] A selachian of the subclass *Plagiostomi*, of an elongate form, with the pectoral fins moderately developed, the branchial apertures lateral, and the mouth inferior (rarely terminal). Over 150 species are known as inhabitants of the modern seas, and sharks formed a very important or even predominant contingent to the fauna of early epochs. The internal differences manifested by species having a considerable resemblance externally are so great as to have led some naturalists to propose for them three distinct orders, which have been named *Anarthri*, *Proarthri*, and *Opistharthri*. Most living sharks belong to the first order and represent therein 15 families, while of the *Proarthri* only one family with 4 species is known, and of the *Opistharthri* two families with 6 or 7 species. Most sharks are carnivorous, and some of them eminently so; their dentition corresponds to this character, the teeth being often compressed, with trenchant and frequently serrated edges, arranged in many rows, and folded back on the jaws, leaving only the outermost erect for action. These rows of teeth successively come into functional position. In others, however, the teeth are flattish and not erectile. In a few, also, which attain a large size, the teeth are extremely small, and the animal feeds upon very small animals, being not truly carnivorous. The skin is generally covered with small scales or plates firmly adherent to the skin and overlapping, forming shagreen. (See cut under *scale*.) But various deviations are manifested in different forms, and in one, *Echinorhinidae*, the surface is mostly naked, only some thorn-like plates being developed. Sharks inhabit for the most part tropical and warm waters; the larger ones live in the open sea, but a few species extend into high north and south latitudes. The largest shark is *Rhinodon typicus*, the whale-shark, said to attain a length of over 50 feet. Next in size is the great basking-shark, *Cetorhinus maximus*, which is reported occasionally to reach a length of 40 feet. (See *Cetorhinus*, and cut under *basking-shark*.) Another large species is *Carcharodon ron-*

*shear* sheep (that is, a sheep one or two years old), in allusion to the yearly shearing.—2. A

barbed fish-spear with several prongs. *E. H. Knight.*—3. A strain consisting of a compression in one direction with an elongation in the

same ratio in a direction perpendicular to the first. Thus, in fig. 1, suppose a body in which the axis

AC is compressed to *ac*. Suppose there is an axis of equal

elongation, upon which take BD equal to *ac*, so that after elongation it will

be brought to *bd*, equal to AC. Then, all planes perpendicular to the plane of

the diagram and parallel either to AB or to AD will remain undistorted,

being simply rotated into positions parallel to *ab* or *ad*. If the body while

undergoing strain be so rotated that a and b remain in coincidence with A

and B (see fig. 2), the shear will be seen

to be an advance of all planes parallel to a fixed plane in parallel lines in those

planes by amounts proportional to their distances from the fixed plane. A shear

is often called a *simple shear*, meaning a shear uncompounded with any other

strain. Any simple strain may be re-

solved into a shear, a positive or negative elongation per-

pendicular to the shear, and a positive or negative ex-

pansion.

4. Deflection or deviation from the straight;

curve or sweep; sheer: as, the *shear* of a boat.

Some considerable *shear* to the bow lines will make a

drier and safer boat.

simple shears.—**Double shear**. (a) In *dynam.*, a com-

doubling and welding.

genus *Thaumastura* is now usually restricted, the others formerly referred to it being placed in *Doricha* the structure of the tail is peculiar: for the middle pair of feathers is so short as to be almost hidden by the coverts, while the next pair is suddenly and extremely lengthened and then the other three pairs rapidly shorten from within outward. In *Doricha* (*D. hemicura*, etc.) the shape of the tail is simply forcetate, as the feathers lengthen from the shortest middle pair to the longest outer pair, like a

tern's. In all these cases the long feathers are very narrow and linear, or of about uniform width to their ends. The peculiar formation is confined to the males. *T. cora* has the tail (in the male) about 4 inches long, though the length of the bird is scarcely 6 inches; it is golden-green above and mostly white below, with a metallic crimson gorget reflecting blue in some lights, and the tail black and white. Some of them are known as *hags* or *haydens*. Three of the commonest are the greater shearwater, *P. major*; the Manx shearwater, *P. anglorum*; and the sooty shearwater, *P. fuliginosus*, all of the North Atlantic. **sheep**<sup>1</sup> (shēp), *n.* pl. *sheep*. [< ME. *sheep*, *shep*, *sheep*, *schepe*, *scēap*, *scep*, *sep* (pl. *sheep*, *sheep*), < AS. *scēap*, *scēp* (pl. *scēap*, *scēp*) = OS. *scāp* = OFries. *skēp*, *schēp* = D. *schaap* = MLG. *schāp*, LG. *schaap* = OHG. *scāf*, MHG. *G. schaf*, *sheep*; root unknown. Not found in Goth., where *lamb* (= E. *lamb*) is used, nor in Scand., where Icel. *fær* = Sw. *får* = Dan. *får*, *sheep*, appears (see *Far-oes*).] 1. A ruminant mammal of the family *Bovidae*, subfamily *Ovis*, and genus *Ovis*: specifically, *Ovis aries*, domesticated in many varieties, and one of the animals most useful to man. The male is a ram, the female a ewe, and the young a lamb; the flesh of the adult is mutton; of the young, lamb; the coat or fleece is wool, a principal material of warm clothing; the prepared hide is sheepskin, used for many purposes; the entrails furnish sausage-cases, and are also dried and twisted into strings for musical instruments ("catgut"); the prepared fat makes tallow or suet; and the twisted horns of the ram are used in the manufacture of various utensils. The milk of the ewe is thicker than that of the cow, yielding a relatively greater quantity of butter and cheese. The sheep is one of the most harmless and timid of animals. The artificial breeds of *O. aries* are numerous; it is not known from what wild stock or stocks they are descended. The mouflon is a probable ancestor of some at least of the domestic varieties, especially those with short tail and crescentic horns. The principal English varieties of the sheep are the large Leicester, the Cotswold, the Southdown, the Cheviot, and the black-faced breeds. The Leicester comes early to maturity, attains a large size, has a fine full form, and carries more mutton, though not of finest quality, in the same apparent dimensions than any other; the wool is not so long as in some other breeds, but is considerably finer. The Cotswolds have been improved by crossing with Leicesters; their wool is fine, and their mutton fine-grained and full-sized. Southdowns have short, close, and curled wool, and their mutton is highly valued for its flavor; they attain a large size. All these require a good climate and rich pasture. The Cheviot is much hardier, and is well adapted for the green, grassy hills of Highland districts; the wool is short, thick, and fine. The Cheviot possesses good fattening qualities, and yields excellent mutton. The black-faced is hardiest of all, and adapted for wild heathery hills and moors; its wool is long and coarse, but its mutton is the very finest. The Welsh resembles the black-faced, but is less hardy; its mutton is delicious, but its fleece weighs only about 2 pounds. The foreign breeds of sheep are numerous, some of the more remarkable being (a) the broad-tailed sheep, common in Asia and Egypt, and remarkable for its large heavy tail; (b) the Iceland sheep, having three, four, or five horns; (c) the fat-rumped sheep of Tartary, with an accumulation of fat on the rump, which, falling down in two great masses behind, often entirely conceals the tail; (d) the Astrakhan or Bucharian sheep, with the wool twisted in spiral curls, and of very fine quality; (e) the Wallachian or Cretan sheep, with very large, long, and spiral horns, those of the male being upright, and those of the female at right angles with the head. All the wild species of *Ovis* have the book-name *sheep*, and also particular designations. (See *argali*, *bighorn*, *mouflon*, *musimon*.) The only indigenous form in the New World is the Rocky Mountain sheep, or bighorn, *O. montana*. Certain *Ovis* of modern genera detached from *Ovis* are called sheep with a qualifying term, as the aoudad, or Barbary sheep. See cuts under *aoudad*, *bighorn*, *merino*, *Ovis*, *quadricon*, and *Ruminantia*.

Those [eyes] of an amorous, roguish look derive their title even from the sheep; and we say such a one has a sheep's eye, not so much to denote the innocence as the simple slyness of the cast.

In fore-and-aft sails—except gaff-topsails, where the reverse is the case—the sheet secures the after lower corner and the tack the forward lower corner. In studsails the tack secures the outer clue and the sheet the inner one.

Each of these sheldrakes is represented in Australian, Papuan, and Polynesian regions by such forms as *Tadorna radjah*, *Casarca tadornoides*, and *C. variegata*. No sheldrakes properly so called are American.

2. In *zool.*, a hard outer case or covering; a crust; a test; a lorica; a carapace; an indurated (osseous, cartilaginous, cuticular, chitinous, calcareous, silicious, etc.) integument or part of integument. (See *exoskeleton*.) Specifically—(a) In *mammal.*, the peculiar integument of an armadillo, forming a carapace, and sometimes also a plastron, as in the fossil glyptodons. (b) An egg-shell.

(e) In *Mollusca*, the test of any mollusk; the valve or valves of a shell-fish; the chitinated or calcified product of the mantle; a conch. A shell in one, two, or several pieces is so highly characteristic of mollusks that these animals are commonly called *shell-fish* collectively, and many of them are grouped as *Testacea*, *Conchifera*, etc. In some mollusks, as dibranchiate cephalopods, the shell is internal, constituting the pen or cuttle (see *calamary*); in others there is no shell. The shell is secreted chiefly by a mantle or folds of the mantle which are developed around the soft parts, and is usually composed of carbonate of lime. It is generally univalve and spiral, as in most gastropods. In chitons there are eight valves imbricated in a longitudinal series, bound together by a marginal band. In bivalves two shells are developed from and cover the sides of the animal, right and left. (See cuts under *bivalve*.) Some mollusks otherwise bivalve have accessory valves. (f) In *Brachiopoda* there are two valves, but one covers the back and the other the abdominal region, so that the valves are dorsal and ventral. These shells are sometimes composed chiefly of phosphate of lime, as in *lingulas*. (g) In *Crustacea*, the hard chitinous or calcareous integument or crust, or some special part of it: as, the shell of a crab or lobster. (h) In *entom.*: (1) The wing-case of a beetle; an elytron; a shield: as, "cases or shells (elytra)," *Swainson and Shuckard*. (2) The cast skin of a pupa, especially of lepidopterous insects; a pupa-shell. (i) In *echinodermata*, the hard crust or integument, especially when it coheres in one hollow case or covering; a test: as, the shell of a sea-urchin. (j) In *Vermes*, the tube or case of a tubicolous worm, when hard, thick, or rigid, like a mollusk's shell: as, the shell of a serpulid. (k) In some *Protozoa*, a silicious or calcareous test or lorica of any kind. Such shells are present under numberless modifications, often beautifully shaped and highly complicated, perforated, cambered, etc., as in foraminifers, radiolarians, sun-animalcules, many infusorians, etc.

3. In *anat.*, some hard thin or hollowed part. (a) A turbinate bone; a scroll-bone. (b) A hollow cylindrical cast or exfoliation, as of necrosed bone; a squama. 4. The outer ear, auricle, or conch: as, pearly shells or pink shells. [Chiefly poetical.]

5. A shelled or testaceous mollusk; a shell-fish. In this sense *shell* may be added, with or without a hyphen, to numerous words, serving to specify mollusks or groups of mollusks. Some of the best-established of such combinations are noted after the phrases given below.

(b) Any framework or exterior structure regarded as not being completed or filled in.

The Marquis of Medina Cidonia, in his viceroyalty, made the shell of a house, which he had not time to finish, that commands a view of the whole bay, and would have been a very noble building had he brought it to perfection. Addison, Remarks on Italy (Works, ed. Bohn, I. 426).

(c) A kind of rough coffin; also, a thin coffin designed to be inclosed by a more substantial one. (d) A racing-boat of light build, long, low, and narrow (generally made of cedar

They held possession of Paris for a while, and committed many outrages, especially upon the Jews. The movement was soon suppressed. An outbreak of mendicants similarly named took place under Philip V. in 1299, but this also soon came to an end.

**sheriff**<sup>1</sup> (sher'if), *n.* [Also sometimes in the restored or explanatory form *shire-reeve*; also sometimes contracted *shrieve*, early mod. E. *sheriffe, schereff, shireeve*, etc., *< ME. shereve, schereve, shireve, shirreve, schyreve, schirreve, syrreve* (pl. *shireves, schirreves, shrives*), *< AS. scir-gerefa*, 'shire-reeve,' *< scire*, shire, + *gerefa*, a reeve, officer: see *shire*<sup>1</sup> and *reeve*. Cf. *townreeve, portreeve*.] The chief civil officer charged with administering justice within a county, under direction of the courts, or of the crown or other executive head of the state, and usually having also some incidental judicial functions. (a) In England, the chief officer of the crown in every county or shire, who does all the sovereign's business in the county, the crown by letters patent committing the custody of the county to him alone. Sheriffs are appointed by the crown upon presentation of the judges in a manner partly regulated by law and partly by custom (see *pricking*); the citizens of London, however, have the right of electing the sheriffs for the city of London and the county of Middlesex. Those appointed are bound under a penalty to serve the office, except in specified cases of exemption or disability. As keeper of the queen's peace, the sheriff is the first man in the county, and superior in rank to any nobleman therein during his office, which he holds for a year. He is specially intrusted with the execution of the laws and the preservation of the peace, and for this purpose he has at his disposal the whole civil force of the county—in old legal phraseology, *the posse comitatus*. He has also some judicial functions, less extensive now than formerly. The most ordinary of his functions, which he always executes by a deputy called *under-sheriff*, consists in the execution of writs. The sheriff performs in person such duties only as are either purely honorary, such as attendance upon the judges on circuit, or of some dignity and public importance, such as the presiding over elections and the holding of county meetings, which he may call at any time.

A *shirreeve* hadde he been and a countour.

(b) In Scotland, the chief local judge of a county. There are two grades of sheriffs, the chief or superior sheriffs and the sheriffs-substitute (besides the lord lieutenant of the county, who has the honorary title of *sheriff-principal*), both being appointed by the crown. The chief sheriff, usually called simply the *sheriff*, may have more than one substitute under him, and the discharge of the greater part of the duties of the office now practically rests with the sheriffs-substitute, the sheriff being (except in one or two cases) a practising advocate in Edinburgh, while the sheriff-substitute is prohibited from taking other employment, and must reside within his county. The civil jurisdiction of the sheriff extends to all personal actions on contract, bond, or obligation without limit, actions for rent, possessory actions, etc., in which cases there is an appeal from the decision of the sheriff-substitute to the sheriff, and from him to the Court of Session. He has also a summary jurisdiction in small-debt cases where the value is not more than £12. In criminal cases the sheriff has jurisdiction in all offenses the punishment for which is not more than two years' imprisonment. He has also jurisdiction in bankruptcy cases to any amount. (c) In the United States, except in New Hampshire and Rhode Island, sheriffs are elected by popular vote, the qualification being that the sheriff must be a man, of age, a citizen of the United States and of the State, and a resident in the county; usually he can hold no other office, and is not eligible for reelection until after the lapse of a limited period. In all the States there are deputy sheriffs, who are agents and servants of the sheriff. In New York and some other States there is, as in England, an under-sheriff, who acts in place of his chief in the latter's absence, etc. The principal duties of the sheriff are to preserve peace and order throughout the county, to attend the courts as the administrative officer of the law, to guard prisoners and juries, to serve the process and execute the judgments of the courts, and to preside at inquisitions and assessments of damages on default.—**High sheriff**, the sheriff as distinguished from the under-sheriff and other deputies. **Joint sheriff**, two persons jointly appointed sheriff, or one of such persons.—**Sheriff of Middlesex case**, a decision in 1840, noted in English constitutional history, on the relative powers of Parliament, to imprison for contempt and the courts to discharge on habeas corpus.—**Sheriff's jury**. The Shiahs "are also called the Imamiyah, because they believe the Muslim religion consists in the true knowledge of the Imam or rightful leaders of the faithful" (*Hughes*, *Diet. Islam.*, *see Imam and alif*). They claim to be the orthodox Mohammedans, but are treated by the Sunnis as heretics. The Shiahs comprise nearly the whole Persian nation, and are also found in Oudh, a province of British India; but the Mohammedans of the other parts of India are for the most part Sunnis. Those who had not this decoration were called *sotto voce* in the school-room and yelled after in the grove, *Shig-shag!* this opprobrious epithet, when uttered at close quarters, being generally accompanied by three pinches. No boy who cared for his peace of mind and wished to save himself some "nips and twinks" would appear in school without at least an oak-leaf in honour of the day.

Some connect the word with *shell* and *scale*<sup>1</sup>, as denoting a thin piece of wood or metal (see *shell* and *scale*<sup>1</sup>), others with *Icel. skella*, *skjalla*, clash, rattle.]. 1. A frame or rounded plate made of wood, metal, hide, or leather, carried by warriors on the arm or in the hand, as a defense, from remote antiquity until the perfection of firearms rendered it more an*

encombrance than a safeguard, and by savage peoples to the present day. Specially distinguished from the rest, covering the body at least on one side, and carried on the

arm, which passed through rings or straps on its inner side, or hung round the neck by a girth or strap. The shield of the middle ages was in the tenth century very long, pointed at the bottom and rounded at the top. (See *kite-shield*, below.) At later periods it was changed in size and shape, becoming shorter and smaller, at first triangular and afterward broad, short, and pointed. (See *écu*, and *tilting-shield* below.) In the fifteenth century the shield proper was reduced to the just, and soon after disappeared, leaving the chief of the head-shield used for parrying blows, see *buckler*; for the large shield used in sieges, see *breast-plate*. Shields of barbarous peoples differ greatly in size, shape, and material; thus, those of the peoples of north Africa made of hide, are nearly six feet long; those of the Mussulman nations are much smaller and usually round. See also cuts under *buckler*, *cuirass*, *écu*, *écu*, *écu*, *petta*, *rondache*, and *scutum*.

Ships are of various sizes and fitted for various uses, and receive different names, according to their rig, motive power (wind or steam or both), and the purposes to which they are applied, as war-ships, transports, merchantmen, barks, brigs, schooners, luggers, sloops, zebecs, galley, etc. The name *ship*, as descriptive of a particular rig, and as implying a certain size, has been used to designate a vessel furnished with a bowsprit and three masts—a mainmast, a foremast, and a mizzenmast—each of which is composed of a lower mast, a topmast, and a topgallantmast, and carries a certain number of square sails. The square sails on the mizzen distinguish a ship from a bark, a bark having only fore and aft sails on the mainmast. But the development of coastwise navigation, in which the largest vessels have generally a schooner rig and sometimes four masts, has

gone far toward rendering this restricted application of the word of little value. Owing to increase of size, and especially increase in length, some sailing vessels now have four masts, and this rig is said to have certain advantages. Until recent times wood, such as oak, pine, etc., was the material of which ships were constructed, but it is being rapidly superseded by iron and steel, and in Great Britain, which is the chief ship-building country in the world, the tonnage of the wooden vessels constructed is small compared with that of vessels built of iron. The first iron vessel classed at Lloyd's was built at Liverpool in 1833, but iron barges and small vessels had been constructed long before this. Four-masted vessels which are square-rigged on all four masts are called *four-masted ships*; those which have fore-and-aft sails on the after mast are called *four-masted barks*. 'separate,' 'cut off,' a secondary form of *sceran, sceoran, sciran*, cut off, shear: see *shear*.] The AS. *scire, scyre* (often erroneously written with a long vowel, *scire, scyre*) is commonly explained as lit. a 'share' or 'portion' (i. e. 'a section, division'), directly *< sceran, sciran*, cut: see *shear*, and cf. *share*, from the same source. The mod. pron. with a long vowel is due to the lengthening of the orig. short vowel, as in the other words with a short radical vowel followed by *r* before a vowel which has become silent (e. g. *mare*, *ti*).] 1. The name *scir* [AS. *scire*] or *shire*, which marks the division immediately superior to the hundred, merely means a subdivision or share of a larger whole, and was early used in connexion with an official name to designate the territorial sphere appointed to the particular magistracy denoted by that name. So the diocese was the bishop's *scire*, and the stewardship of the unjust steward is called in the Anglo-Saxon translation of the Gospel his *grafscire*. The presence of the ealdorman and the bishop, who legally sat with him (the sheriff) in the *shire-moot*, and whose presence recalled the folk-moot from which it sprang, would necessarily be rare and irregular, while the reeve was bound to attend; and the result of this is seen in the way in which the *shire-moot* soon became known simply as the sheriff's court.

J. R. Green, *Conquest of England*, p. 230.

The *shiremoot*, like the hundredmoot, was competent to declare folkright in every suit, but its relation to the lower court was not, properly speaking, an appellate jurisdiction. Its function was to secure to the suitor the right which he had failed to obtain in the hundred.

The word is more often used of the effect than of the action: as, the *shock* of battle, a *shock* of electricity, the *shock* from the sudden announcement of bad news. A *collision* is the dashing of a moving body upon a body moving or still: as, a railroad *collision*; *collision* of steamships. *Concussion* is a shaking together; hence the word is especially applicable where that which is shaken has, or may be thought of as having, parts: as, *concussion* of the air or of the brain. *Collision* implies the solidity of the colliding objects: as, the *collision* of two cannon-balls in the air. A *jolt* is a shaking by a single abrupt jerking motion upward or downward or both, as by a springless wagon on a rough road. *Shock* is used figuratively; we speak sometimes of the *collision* of ideas or of minds; *concussion* and *jolt* are only literal.

(= Chin. *tsung kin*, handle (or lead) the army). *< shō* (= Chin. *tsiang*, take, hold, have charge of, or lead in fight, + *gun* (= Chin. *kin, kun*, army).]* General: the title of the commander-in-chief or captain-general of the Japanese army during the continuance of the feudal system in that country.

More fully called *taishōgun* ('great general'), or *sei-tai shōgun*, 'barbarian-subduing-great-general'—the earlier wars of the Japanese (when this form of the title was first used) having been waged against the 'barbarians' or aboriginal inhabitants of the country. The office was made hereditary in the Minamoto family in 1192, when the title was bestowed on a famous warrior and hero named Yoritomo, and continued in that family or some branch of it until 1868, when it was abolished, and the feudal system virtually came to an end. From the first a large share of the governing power naturally devolved on the shogun as the chief vassal of the mikado. This power was gradually extended by the encroachments of successive shoguns, especially of Iyeyasu, founder in 1603 of the Tokugawa line, and in course of time the shoguns became the virtual rulers of the country—always, however, acknowledging the supremacy of the mikado, and professing to act in his name. This state of things has given rise to the common but erroneous opinion and assertion that Japan had two emperors—"a spiritual emperor" (the mikado), living in Kioto, and "a temporal emperor" (the shogun), who held court in Yedo (now called Tokio). In the troubles which arose subsequent to 1868 in connection with the ratification and enforcement of the treaties which the shogunate had made with foreign nations, establishing trade relations, etc., many of the daimios, tired of the domination of the shogun and disapproving of the treaties, sided with the emperor; this led in 1867 to the resignation of the shogun of the time, and in the following year the office was abolished, the reigning mikado undertaking to govern the country in person. **14. Not prolonged in utterance; less in duration than times or sounds called long: said of times, vowels, and syllables. Specifically**

(a) *breve*, not exceeding in duration the half of the *long* equivalent, or so regarded. The *breve* is a vowel of recent pronunciation varied somewhat in actual duration, but seems to have been a vowel of equal length as was consistent with all fastidiousness of setting. (*See long*, *v.*) Sometimes in metrical or rhetorical treatment a short syllable occupies the time in utterance than a normal short (was a *diminished* short, *diminished* short), and in what is usually called an *anapaest* the first of two vowel-sounds, although still audible, was shortened to such a degree as to be entirely disregarded in metrical consideration. A syllable containing a short vowel was regarded as short, unless the vowel stood in position (which, *see*). Rhythmic and musical composition occasionally allowed itself the liberty of treating a prosodic short as a long (an *augmented short*, *augmented short*, and *breve* *breve*). In metrical composition a short syllable usually did not take the ictus; hence, in modern versification, an unaccented syllable, whatever its duration, is said to be *short*. Shorthand was used by the Greeks and Romans, but all knowledge of the art was lost from the tenth to the sixteenth century, when modern shorthand had its inception in the treatises of Dr. Timothy Bright (1586) and Peter Bales (1600), in which arbitrary signs were used to represent each word. The first system of any practical importance was that of John Willis (1602), which was based on the common alphabet with the addition of arbitrary signs. Among Willis's imitators were T. Shelton (1626), Jeremiah Rich (1642), William Mason (1662), Thomas Gurney (1756), John Byrom (1767), William Mavor (1779), and Samuel Taylor (1786). Taylor's was considered the best of the *a-b-c* systems, and was largely used until Isaac Pitman (1837) invented phonography, which, as variously modified by its originator and others, has been more widely adopted than any other method. In its improved form (ninth edition 1852, tenth edition 1857) it is the system best known in the United States. It has been modified by Benn Pitman (brother of Isaac), A. J. Graham, J. E. Munson, Osgoodby, Burnz, and others. In this system speeds ranging from 200 to 250 words per minute, for ten minutes' continuous writing from new matter with accurate transcripts, have been attained. It has been adapted to the French, German, Spanish, and other languages.

3. A small ball or pellet, of which a number are combined in one charge; also, such pellets collectively. They are made by running molten lead combined with a little arsenic through a sieve, or pouring it from a ladle with a serrated edge from the top of a high tower (see *shot-tower*) into water at the bottom. The stream of metal breaks into drops which become spherical. To obviate the use of the high tower, various expedients have been tried, such as dropping the metal through a tube up through which a strong current of air is drawn, or dropping it through a column of live iron or oil. *Shot* is also used by sizes of the pellets distinguished by letters (as *B*, spoken *double-B*), or by numbers (usually Nos. 1 to 10 or 12, or by specific names (as *swan shot*, etc.).

**shot-gun** (shot'gun), *n.* A smooth-bore gun used for firing small shot, as in the chase of birds and small quadrupeds; a fowling-piece: commonly called *gun* simply, in implied distinction from *rifle* or other small-arm. Some shot-guns are too heavy to be brought to the shoulder. (See *pump-gun*, *ducking-gun*.) Shot-guns are usually either single-barreled or double-barreled; rarely a third barrel is added; sometimes one of the barrels is rifled (see the quotation). Besides being smooth-bored, a shot-gun differs from any form of rifle in having no hind-sight and a simple pin as fore-sight. Shot-guns are also distinguished as *muzzle-loaders* and *breech-loaders*; the former are little used now. Though the bore is always smooth, it is often contracted toward the muzzle to concentrate the discharge. (See *choke-bore*.) The standard shot-gun now most used by sportsmen is the double-barreled breech-loader, of 7 to 10 pounds weight, about 30 inches length of barrel, length and drop of stock fitting the shooter, often with pistol-grip, caliber usually 10, 12, or 14, and taking corresponding sizes of paper or metal shot-cartridges (see *shell*) with center-fire primers or percussion-caps and an automatic ejector; such as have the cock or hammer concealed in the mechanism of the lock are specified as *hammerless*. The special makes are numberless, but decided variations from the standard pattern are rare. Shot-guns are seldom fitted with hair-triggers, but usually with rebounding locks, in which the hammer flies back to half-cock on delivering the blow on the plunger. A special form of shot-gun, used by naturalists, is described under *cane-gun*.

The human *shoulder-blade* is somewhat peculiar in shape, and some of its parts are named in terms not applicable or seldom applied to scapulae in general. It is a compound bone, including a coracoid as a mere process, and develops from seven centers of ossification, two of which are coracoid. It is commonly said to have two surfaces, three borders, and three angles. Of these, the ventral surface, which lies upon the ribs, is the *venter*; the other surface is the *dorsum*. This latter is unequally divided into two parts by the development of a high ridge, the *spine*, extended into a stout process, the *acromion*. The flat part above the spine is the *supraspinous fossa*; that below the spine, the *infraspinous fossa*; the venter is also called the *subscapular fossa*. These three fossae indicate the primitively prismatic and rod-like character of the bone; and they correspond respectively to the *prescapular*, *postscapular*, and *subscapular* surfaces of a more general nomenclature. The spine being actually in the axis of the scapula, it follows that the long *vertebral border* ( $a_1$  to  $a_2$  in the figure) is the proximal end of the bone. The *glenoid fossa* is at the other end of the bone, at its confluence with the coracoid. The

Human *Shoulder-blade* or *Scapula* (right, dorsal surface).  $a_1$ , superior angle;  $a_2$ , inferior angle;  $a_3$ , acromion;  $a_4$ , clavary border;  $a_5$ , coracoid;  $a_6$ , glenoid fossa;  $a_7$ , articular surface with humerus;  $a_8$ , infraspinous fossa;  $a_9$ , neck and lip of scapular notch in superior border;  $a_{10}$ , spine;  $a_{11}$ , supraspinous fossa;  $a_{12}$ , vertebral border, extending from  $a_1$  to  $a_{13}$ .

*axillary border* is one edge of the primitive prism; the *superior border* is another; and the third is along the free edge of the spine. The *suprascapular notch* in the superior border (converted into a foramen by a ligament) denotes the passage there of the vessels and nerve called by the same name. The peculiarities of the human scapula result mainly from its extensive growth downward to the inferior angle ( $a_2$ ), with consequent lengthening of the axillary border and of the so-called vertebral "border," and from great development of the spine and acromion. This bone, as usual in the higher vertebrates, has two articulations—with the clavicle and with the humerus; excepting the acromioclavicular articulation, it is attached to the trunk solely by muscles, of which sixteen (sometimes seventeen) arise from or are inserted into the bone. (Compare the shape of the rabbit's *shoulder-blade*, figured under *metacromion*, and of a bird's, under *scapula*.) See also cut under *shoulder*.

dle for the reception of the bobbin or pirn on which the weft is wound. The weft unwinds from this bobbin as the shuttle runs from one side of the web to the other. It is driven across by a smart blow from a pin called a *picker* or *driver*. There is one of these pins on each side of the loom, and the two are connected by a cord to which a handle is attached. Holding this handle in his right hand, the weaver moves the two pins together in each direction alternately by a sudden jerk. A shuttle propelled in this manner is called a *fly-shuttle*, and was invented in 1738 by John Kay, a mechanic of Colchester, England. Before this invention the weaver took the shuttle between the finger and thumb of each hand alternately and threw it across, by which process much time was lost. The shuttle travels on a roller-carriage drawn by a cord in the shuttle-race below the warp-threads, and having also a set of upper rollers. The shuttle has also a pair of under rollers, one at each end, and travels over the lower series of warp-threads through the shed, being pushed along by the carriage while the warp-threads are passed, without straining them, between the upper rollers of the carriage and the rollers of the shuttle. The root is appar. *σβ-*, which is perhaps = *L. sib-* in *per-sibus*, acute, wise, and related to *Gr. σοφός*, wise (see *sophist*), and *L. sapere*, be wise, perceive: see *sapient*, *sage*.] 1. In *anc. myth.*, one of certain women reputed to possess special powers of prophecy or divination and intercession with the gods in behalf of those who resorted to them. Different writers mention from one to twelve sibyls, but the number commonly reckoned is ten, enumerated as the Persian or Babylonian, Libyan, Delphian, Chymærian, Erythraean, Samian, Cumean, Hellespontine or Trojan, Phrygian, and Tiburtine. Of these the most celebrated was the Cumean sibyl (of Cumæ in Italy), who, according to the story, appeared before Tarquin the Proud and offered him nine books for sale. He refused to buy them, whereupon she burned three, and offered the remaining six at the original price. On being again refused, she destroyed three more, and offered the remaining three at the price she had asked for the nine. Tarquin, astonished at this conduct, bought the books, which were found to contain directions as to the worship of the gods and the policy of the Romans. These sibylline books, or books professing to have this origin, written in Greek hexameters, were kept with great care at Rome, and consulted from time to time by oracle-keepers under the direction of the senate. They were destroyed at the burning of the temple of Jupiter in 83 B. C. Fresh collections were made, which were finally destroyed soon after A. D. 400. The Sibylline Oracles referred to by the Christian fathers belong to early ecclesiastical literature, and are a curious mixture of Jewish and Christian material, with probably here and there a snatch from the older pagan source. In composition they seem to be of various dates, from the second century before to the third century after Christ.

Sick, Ill, Ailing, Unwell, Diseased, Morbid, Sickly*. *Sick* and *ill* are general words for being positively out of a healthy state, as *ailing* and *unwell* are in some sense negative and therefore weaker words for the same thing. There has been some tendency in England to confine *sick* to the distinctive sense of 'nauseated,' but in America the word has continued to have its original breadth of meaning, as found in the Bible and in Shakespeare. *Diseased* follows the tendency of *disease* to be specific, as in *diseased lungs*, or a *diseased leg*—that is, lungs or a leg affected by a certain disease; but the word may be used in a general way. *Morbid* is a more technical or professional term, indicating that which is not healthy or does not act in a healthy way; the word is also the one most freely used in figurative senses: as, *morbid* sensitiveness, self-consciousness, or irritability. *Sick* and *ill* apply to a state presumably temporary, however severe; *sickly* indicates a state not quite equal to sickness, but more permanent, because of an underlying lack of constitutional vigor. See *illness*, *debility*, *disease*.

**Sida** (si'dā), *n.* [NL. (Linnaeus, 1737), < Gr. σῖδα, the pomegranate, a water-lily, also, in Theophrastus, a plant of the genus *Althæa* or other malvaceous plant.] 1. A genus of polypetalous plants of the order *Malvaceæ* and tribe *Malvæ*, type of the subtribe *Sidææ*. It is characterized by solitary pendulous ovules and an ovary of a single ring of five or more carpels, which finally fall away from the axis and are each without appendages and indehiscent, or are sometimes at the summit two-valved, brittle-tipped or beaked. There are about 90 species, natives of warm climates, mostly American, with about 23 in Australia and 8 in Africa and Asia. They are either herbs or shrubs, generally downy or woolly, and bearing flowers sometimes large and variegated, but in most species small and white or yellow. Five or six American species are now naturalized as weeds in almost all warm countries, among which *S. spinosa*, a low yellow-flowered annual, extends north to New York and Iowa. Several species are known as *Indian mallow*; *S. napæa*, a tall white-flowered plant with maple-like leaves, occasional in the eastern United States, is sometimes cultivated under the name *Virginian mallow*; *S. rhombifolia* (from its local use named *Canary Island tea-plant*), a species widely diffused in the tropics, with its variety *retusa*, yields a fiber considered suitable for cordage and paper-making, which, from receiving attention in Australia, has been called *Queensland hemp*.

2. In *zool.*, the typical genus of *Sidææ*.

**siddow** (sid'ō), *a.* [Origin obscure; appar. based on *seethe* (pp. *sodden*), but the form of the termination *-ow* remains to be explained.] Soft; pulpy. [Old and prov. Eng.]

They'l wriggle in and in.

And eat like salt sea in his *siddow* ribs.

Marston, Antonio and Mellida, II., iv. 2.

In Gloucestershire, peas which become pulpy soft by boiling are then said to be *siddow*.

Halliwel, Note to Marston.

**side** (sid), *n.* and *a.* [*< ME. side, syde, rarely sithe, < AS. side = OS. sida = OFries. side =*

MD. *sijde*, D. *zijde* = MLG. *side*, LG. *side*, *sied* = OHG. *sita*, *sitta*, MHG. *sit*, G. *seite* = Icel. *síða* = Sw. *sida* = Dan. *sida* (not recorded in Goth.), *side*; perhaps orig. that which hangs down or is extended, < AS. *sīd*, long, wide, spacious, = Icel. *síðr*, long, hanging down: see *side*<sup>2</sup>. Cf. *beside*, *besides*.] I. n. 1. One of the two terminal surfaces, margins, or lines of an object or a space situated laterally to its front or rear aspect; a part lying on the right or the left hand of an observer, with reference to a definite point of view: as, the *sides* of a building (in contradistinction to its front and rear or back, or to its ends); the *sides* of a map or of a bed (distinguished from the top and bottom, or from the head and foot, respectively).

*Dryden*, *Pal and Arc.*, ii. 620.

2. Specifically, with reference to an animal body: (a) Either half of the body, right or left, which lies on either hand of the vertical median longitudinal plane; the entirety of any lateral part or region: as, the right *side*; the left *side*. (b) The whole or a part of the body in front of or behind a vertical transverse plane: as, the front *side*; the hinder *side*; the dorsal *side*. (c) A part of the body lying laterally with reference to any given or assumed axis, and opposed to another similar or corresponding part: as, the front or back *side* of the arm. (d) A surface or extent of any body, or part of any body, that is external or internal, considered with reference to its opposite: as, the inner or outer *side*. See *inside*, *outside*. (e) Especially, that part of the trunk of an animal which lies or extends between the shoulder and the hip, and particularly the surface of such part; the lateral region or superficies of the chest and belly.

Yet they clefte by my *seydes*.

*Shak.*, M. W. of W., v. 5. 68.

Lest you the Softness of the Sex forsake.

*Congreve*, tr. of Ovid's *Art of Love*, iii.

(f) One of the two most extensive surfaces of anything, being neither top or bottom, nor end, nor edge or border. [Since every organism, like any other solid, has three dimensions, to the extent of which in opposite directions *side* may be applied, it follows that there are three pairs of sides, the word having thus three definitions: a fourth sense is that which relates to the exterior and the (often hollow) interior; a fifth is a definite restriction of right and left *sides*; and a sixth is a loose derived application of the word, without reference to any definite axes or planes.]

3. One of the continuous surfaces of an object limited by terminal lines; one of two or more bounding or investing surfaces; a superficial limit or confine, either external or internal: as, the six *sides* of a cube (but in geometry the word is not thus used for *face*, but as synonymous with *edge*); the *side* of a hill or mountain (*hillside*, *mountain-side*); the upper and under *sides* of a plank; the right and wrong *sides* of a fabric or garment (see phrase below); the *sides* of a cavern or a tunnel. The word *side* may be used either of all the bounding surfaces of an object, as with certain prisms, crystals, and geometrical figures, or as exclusive of parts that may be called *top*, *bottom*, *edge*, or *end*, as with a cubical box, a plank, etc.

Men seith that dune-is [hill's] *sithen* on  
Was mad temple salamon.

*Genesis and Exodus* (E. E. T. S.), i. 1295.

That crawls along the *side* of yon small hill.

*Milton*, *Comus*, i. 295.

4. One of the extended marginal parts or courses of a surface or a plane figure; one of any number of distinct terminal confines or lateral divisions of a surface contiguous to or continuous with another surface: as, the opposite *sides* of a road or a river; the east and west *sides* of the ocean; all *sides* of a field. The outer parts of an oblong or an irregular surface may all be called *sides*, or distinguished as the long and short *sides*, or as *sides* and *ends*, according to occasion. *Side* in this sense is more comprehensive than *margin*, *edge*, *border*, or *verge* (commonly used in defining it), since it may be used so as to include a larger extent of contiguous surface than any of these words. Thus, the *sides* of a room may be all the parts of its floor-space not comprised in a central part reserved or differentiated in some special way. The *sides* of a table are those marginal parts upon which food is served. The east and west *sides* of a continent may constitute jointly the whole of it, or may consist of larger or smaller mar-

ginal strips or divisions, according as they are considered as separated by a mesial line or by some intervening region. The amount of latitude with which the word may be used in particular cases does not admit of definitive discrimination; but there is usually no difficulty in determining the intention of a writer or speaker in his employment of it.

5. Position or place with reference to an intermediate line or area; a space or stretch divided from another by the limit or course of something: preceded by *on* and followed by *of*, either expressed or (sometimes) understood: as, a region on both *sides* of a river; we shall not meet again this *side* the grave.
